

## 16 mΩ high-side driver with analog current sense for automotive applications

Datasheet - production data

HPak

- Self limiting of fast thermal transients
- Protection against loss of ground and loss of  $V_{CC}$
- Overtemperature shutdown with auto restart (thermal shutdown)
- Reverse battery protected
- Electrostatic discharge protection

### Features

|                                   |            |                     |
|-----------------------------------|------------|---------------------|
| Max supply voltage                | $V_{CC}$   | 41 V                |
| Operating voltage range           | $V_{CC}$   | 4.5 to 28 V         |
| Max on-state resistance (per ch.) | $R_{ON}$   | 16 mΩ               |
| Current limitation (typ)          | $I_{LIMH}$ | 73 A                |
| Off-state supply current          | $I_S$      | 2 μA <sup>(1)</sup> |

1. Typical value with all loads connected.

- General
  - Inrush current active management by power limitation
  - Very low standby current
  - 3.0 V CMOS compatible inputs
  - Optimized electromagnetic emissions
  - Very low electromagnetic susceptibility
  - In compliance with the 2002/95/EC European directive
- Diagnostic functions
  - Proportional load current sense
  - High current sense precision for wide current range
  - Current sense disable
  - Overload and short to ground (power limitation) indication
  - Thermal shutdown indication
- Protections
  - Undervoltage shutdown
  - Overvoltage clamp
  - Load current limitation

### Applications

- All types of resistive, inductive and capacitive loads
- Suitable as LED driver

### Description

The VN5E016MH-E is a single channel high-side driver manufactured in the ST proprietary VIPower™ M0-5 technology and housed in the tiny HPak package. The VN5E016MH-E is designed to drive 12 V automotive grounded loads delivering protection, diagnostics and easy 3 V and 5 V CMOS compatible interface with any microcontroller.

The device integrates advanced protective functions such as load current limitation, inrush and overload active management by power limitation, overtemperature shut-off with auto restart and overvoltage active clamp.

A dedicated analog current sense pin is associated with every output channel in order to provide enhanced diagnostic functions including fast detection of overload and short-circuit to ground through power limitation indication and overtemperature indication.

The current sensing and diagnostic feedback of the whole device can be disabled by pulling the CS\_DIS pin high to allow sharing of the external sense resistor with other similar devices.

# 1 Block diagram and pin description

Figure 1. Block diagram

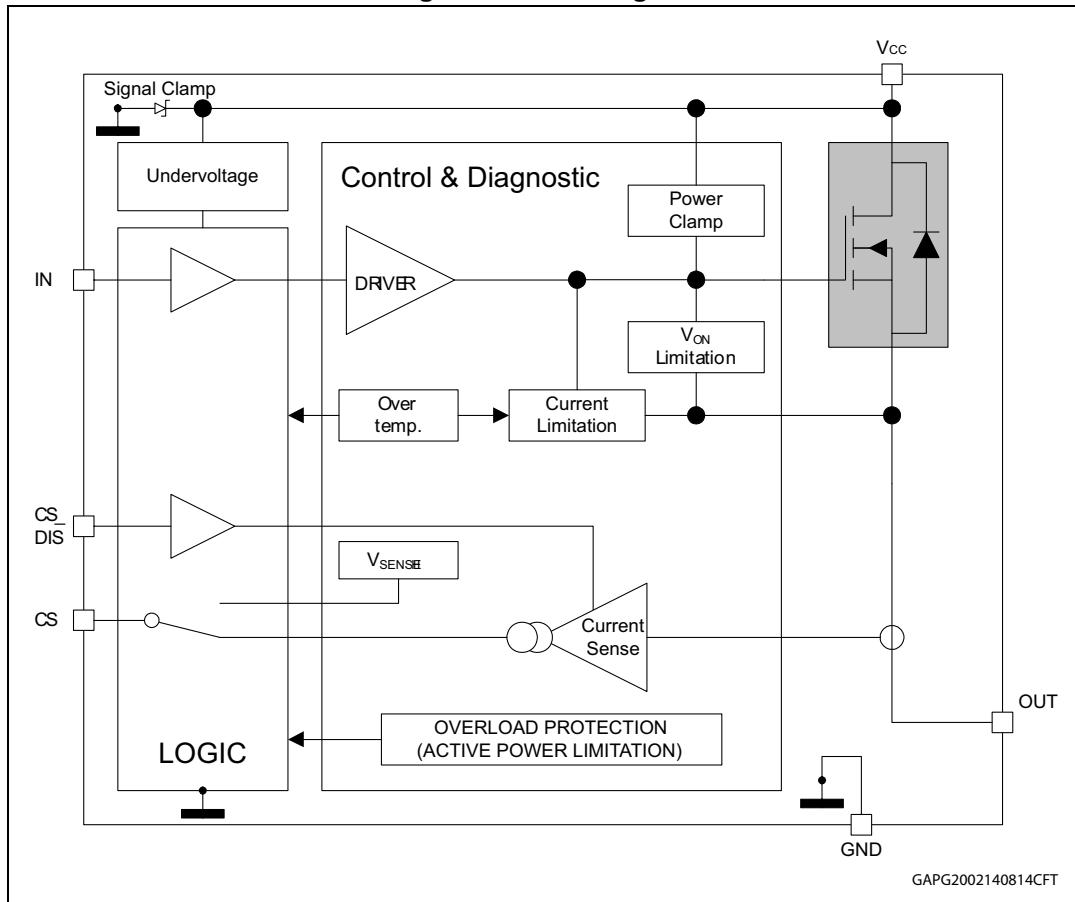

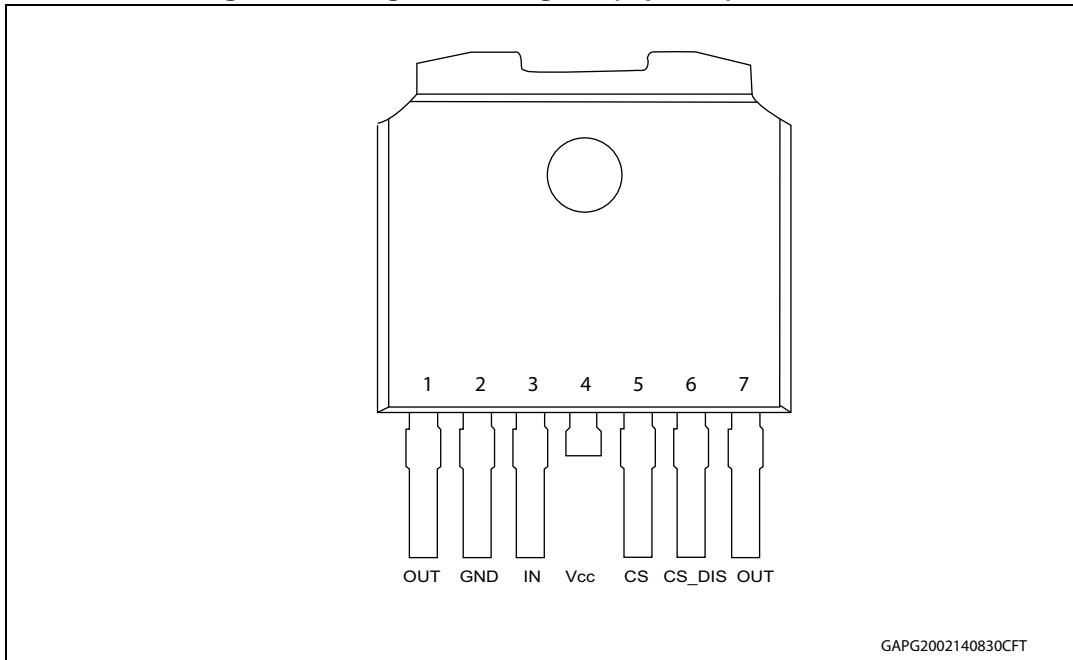

Table 1. Pin functions

| Name            | Function  |
|-----------------|---|
| V <sub>CC</sub> | Battery connection  |
| OUTPUT          | Power output <sup>(1)</sup>   |
| GND             | Ground connection   |
| INPUT           | Voltage controlled input pin with hysteresis, CMOS compatible. Controls output switch state |
| CURRENT SENSE   | Analog current sense pin, delivers a current proportional to the load current               |
| CS_DIS          | Active high CMOS compatible pin, to disable the current sense pin                           |

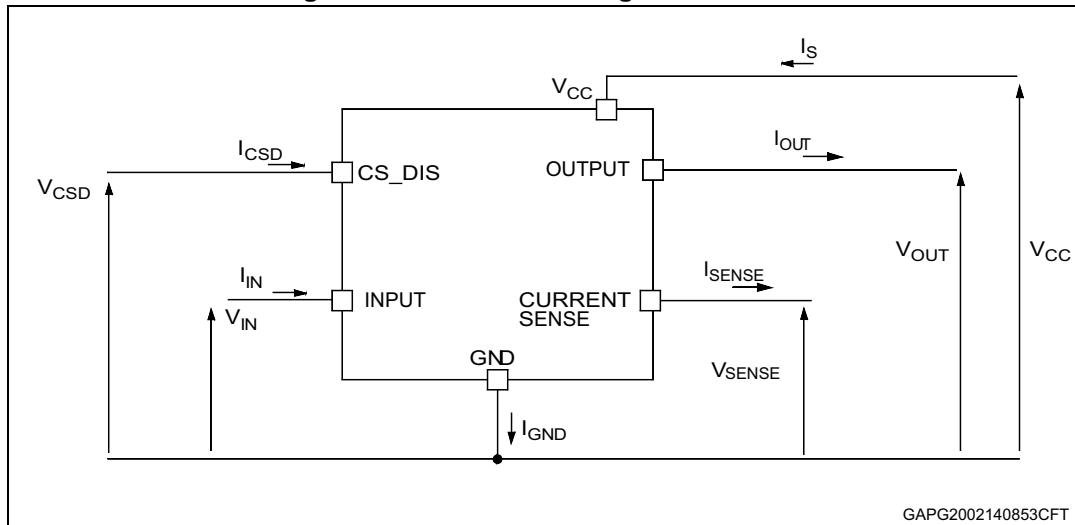

1. Pins 1 and 7 must be externally tied together.

**Figure 2. Configuration diagram (top view) not in scale****Table 2. Suggested connections for unused and not connected pins**

| Connection / pin | Current sense         | Output                 | Input                  | CS_DIS                 |
|------------------|-----------------------|------------------------|------------------------|------------------------|
| Floating         | Not allowed           | X                      | X                      | X                      |
| To ground        | Through 1 kΩ resistor | Through 22 kΩ resistor | Through 10 kΩ resistor | Through 10 kΩ resistor |

## 2 Electrical specifications

Figure 3. Current and voltage conventions

### 2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 3](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Table 3. Absolute maximum ratings

| Symbol       | Parameter  | Value                    | Unit   |
|--------------|--|--------------------------|--------|
| $V_{CC}$     | DC supply voltage  | 41                       | V      |
| $-V_{CC}$    | Reverse DC supply voltage  | 0.3                      | V      |
| $I_{GND}$    | DC reverse ground pin current  | 200                      | mA     |
| $I_{OUT}$    | DC output current  | Internally limited       | A      |
| $-I_{OUT}$   | Reverse DC output current  | 20                       | A      |
| $I_{IN}$     | DC input current   | -1 to 10                 | mA     |
| $I_{CSD}$    | DC current sense disable input current   | -1 to 10                 | mA     |
| $V_{CSENSE}$ | Current sense maximum voltage ( $V_{CC} > 0$ )   | $V_{CC}-41$<br>$+V_{CC}$ | V<br>V |
| $E_{MAX}$    | Maximum switching energy (single pulse)<br>( $L = 1.55 \text{ mH}$ ; $R_L = 0 \Omega$ ; $V_{bat} = 13.5 \text{ V}$ ; $T_{jstart} = 150^\circ\text{C}$ ;<br>$I_{OUT} = I_{limL}(\text{Typ.})$ ) | 350                      | mJ     |

**Table 3. Absolute maximum ratings (continued)**

| Symbol    | Parameter   | Value      | Unit |
|-----------|---|------------|------|
| $V_{ESD}$ | Electrostatic discharge (human body model: $R = 1.5 \text{ k}\Omega$ ; $C = 100 \text{ pF}$ ) |            |      |
|           | – Input   | 4000       | V    |
|           | – Current sense   | 2000       | V    |
|           | – CS_DIS  | 4000       | V    |
|           | – Output  | 5000       | V    |
|           | – $V_{CC}$  | 5000       | V    |
| $V_{ESD}$ | Charge device model (CDM-AEC-Q100-011)  | 750        | V    |
| $T_j$     | Junction operating temperature  | -40 to 150 | °C   |
| $T_{stg}$ | Storage temperature   | -55 to 150 | °C   |

## 2.2 Thermal data

**Table 4. Thermal data**

| Symbol         | Parameter                           | Max. value | Unit |
|----------------|-------------------------------------|------------|------|
| $R_{thj-case}$ | Thermal resistance junction-case    | 0.63       | °C/W |
| $R_{thj-amb}$  | Thermal resistance junction-ambient | 69.3       | °C/W |

## 2.3 Electrical characteristics

Values specified in this section are for  $8 \text{ V} < V_{\text{CC}} < 28 \text{ V}$ ,  $-40^\circ\text{C} < T_j < 150^\circ\text{C}$ , unless otherwise specified.

**Table 5. Power section**

| Symbol               | Parameter                              | Test conditions  | Min. | Typ. | Max. | Unit             |
|----------------------|--|--|------|------|------|------------------|
| $V_{\text{CC}}$      | Operating supply voltage               |  | 4.5  | 13   | 28   | V                |
| $V_{\text{USD}}$     | Undervoltage shutdown                  |  |      | 3.5  | 4.5  | V                |

1. To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

### 3 Application information

**Figure 29. Application schematic**

#### 3.1 GND protection network against reverse battery

##### 3.1.1 Solution 1: resistor in the ground line ( $R_{GND}$ only)

This can be used with any type of load.

The following is an indication on how to set the dimension of  $R_{GND}$  resistor.

$$1) R_{GND} \leq 600 \text{ mV} / (I_{S(on)\max})$$

$$2) R_{GND} \geq (-V_{CC}) / (-I_{GND})$$

where  $-I_{GND}$  is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power dissipation in  $R_{GND}$  (when  $V_{CC} < 0$ : during reverse battery situations) is:

###### Equation 1

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where  $I_{S(on)\max}$  becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not shared by the device ground then the  $R_{GND}$  produces a shift ( $I_{S(on)\max} * R_{GND}$ ) in the input thresholds and the status output values. This shift varies depending on how many devices are ON in the case of several high side drivers sharing the same  $R_{GND}$ .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then ST suggests to utilize Solution 2 (see below).

### 3.1.2 Solution 2: a diode ( $D_{GND}$ ) in the ground line

A resistor ( $R_{GND} = 1 \text{ k}\Omega$ ) should be inserted in parallel to  $D_{GND}$  if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift ( $\approx 600 \text{ mV}$ ) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift not varies if more than one HSD shares the same diode/resistor network.

## 3.2 Load dump protection

$D_{ld}$  is necessary (voltage transient suppressor) if the load dump peak voltage exceeds the  $V_{CC}$  max DC rating. The same applies if the device is subject to transients on the  $V_{CC}$  line that are greater than the ones shown in the ISO T/R 7637/1 table.

## 3.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the  $V_{CC}$  line, the control pins are pulled negative. ST suggests to insert a resistor ( $R_{prot}$ ) in line to prevent the MCU I/O pins from latching-up.

The value of these resistors is a compromise between the leakage current of MCU and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of MCU I/Os.

### Equation 2

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For  $V_{CCpeak} = -100 \text{ V}$  and  $I_{latchup} \geq 20 \text{ mA}$ ;  $V_{OH\mu C} \geq 4.5 \text{ V}$

$$5 \text{ k}\Omega \leq R_{prot} \leq 65 \text{ k}\Omega$$

Recommended values:  $R_{prot} = 10 \text{ k}\Omega$ ,  $C_{EXT} = 10 \text{ nF}$ .

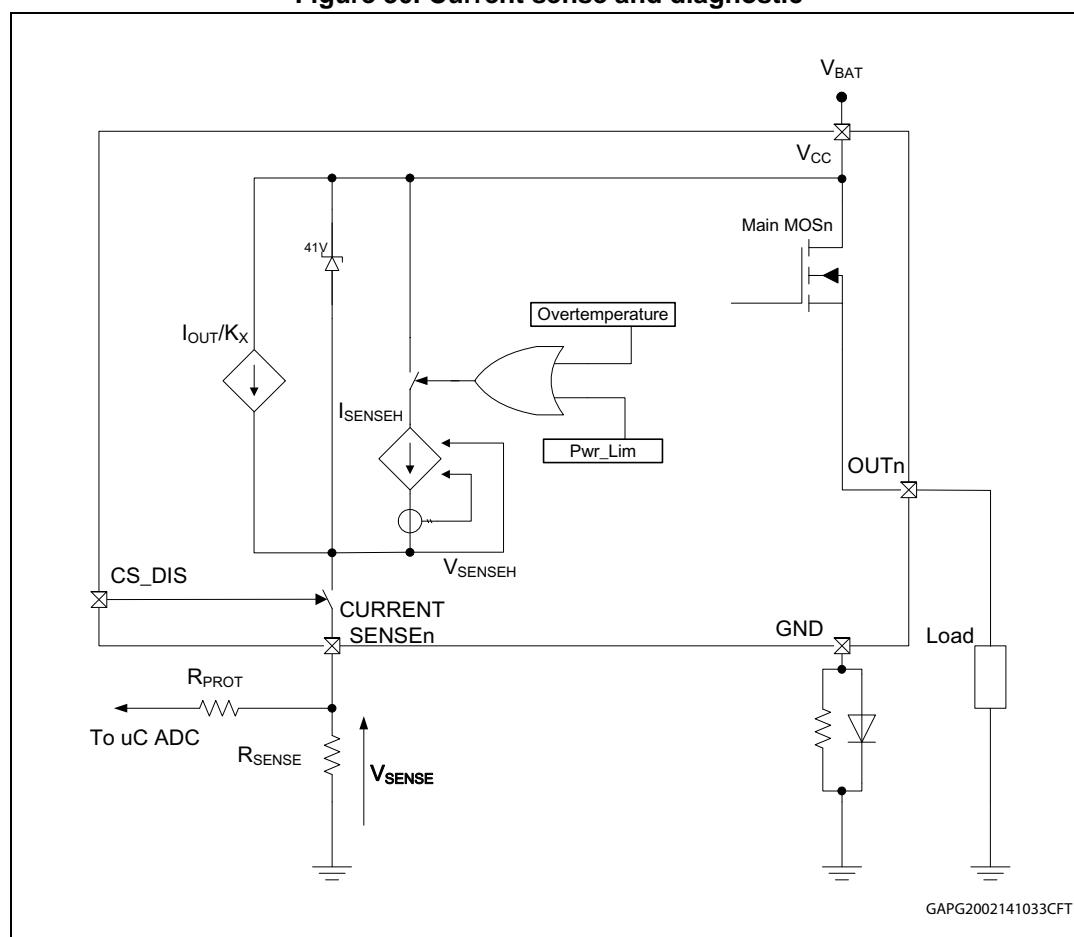

### 3.4 Current sense and diagnostic

The current sense pin performs a double function (see [Figure 30: Current sense and diagnostic](#)):

- **Current mirror of the load current in normal operation**, delivering a current proportional to the load according to a known ratio  $K_x$ .  
The current  $I_{SENSE}$  can be easily converted into a voltage  $V_{SENSE}$  by means of an external resistor  $R_{SENSE}$ . Linearity between  $I_{OUT}$  and  $V_{SENSE}$  is ensured up to 5V minimum (see parameter  $V_{SENSE}$  in [Table 9: Current sense \(8 V < VCC < 18 V\)](#)). The current sense accuracy depends on the output current (refer to current sense electrical characteristics [Table 9: Current sense \(8 V < VCC < 18 V\)](#)).
- **Diagnostic flag in fault conditions**, delivering a fixed voltage  $V_{SENSEH}$  up to a maximum current  $I_{SENSEH}$  in case of the following fault conditions (refer to [Table 10](#)):
  - Power limitation activation
  - Overtemperature

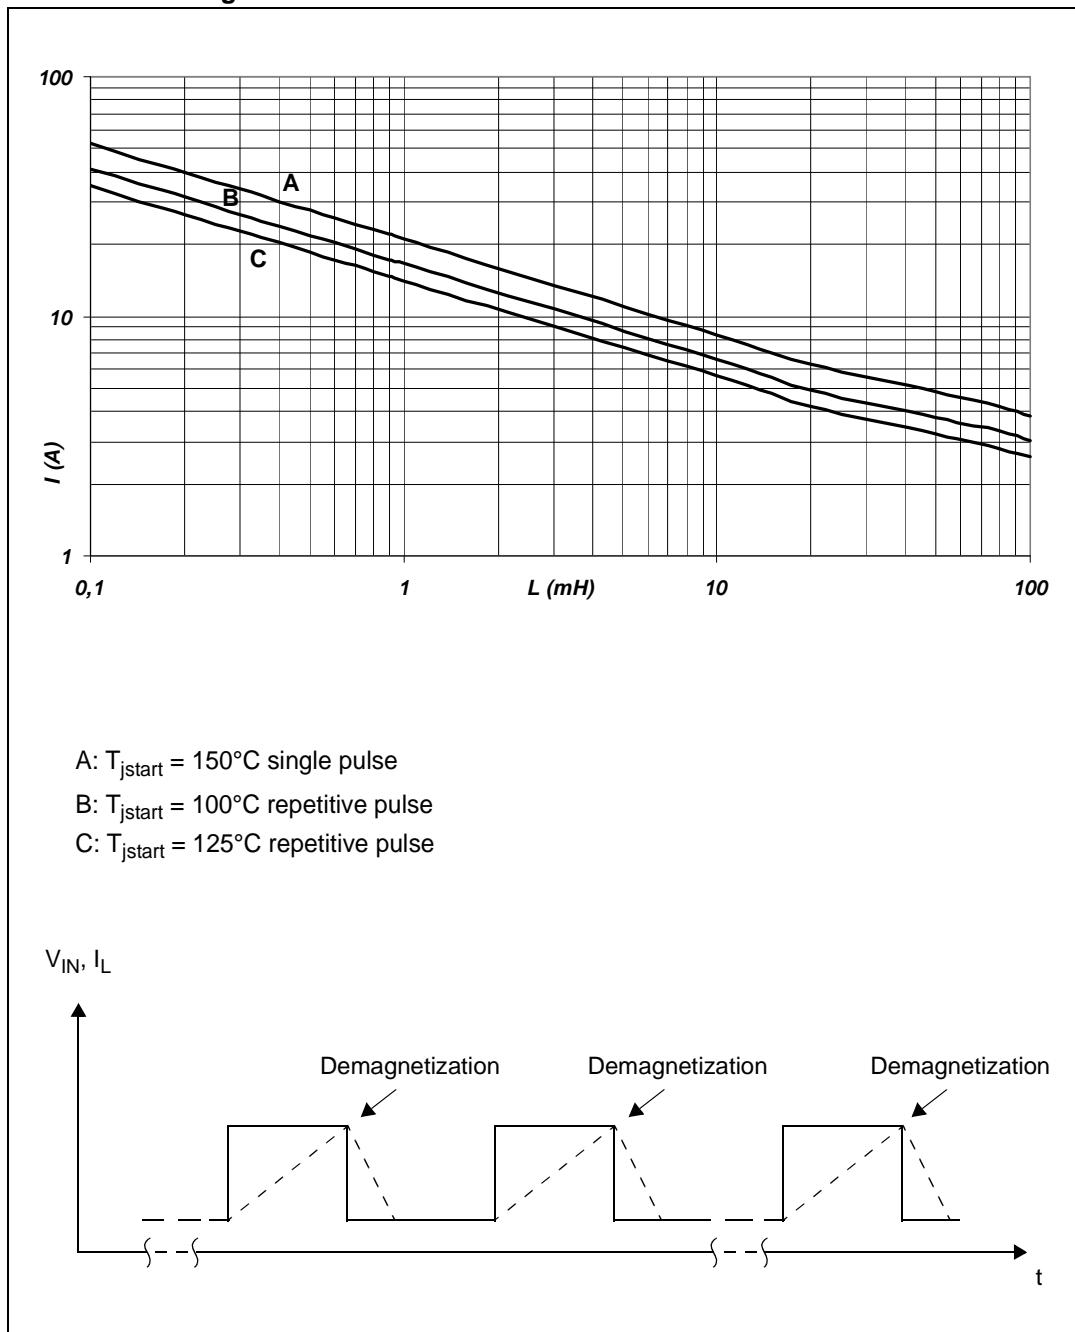

A logic level high on CS\_DIS pin sets at the same time all the current sense pins of the device in a high impedance state, thus disabling the current monitoring and diagnostic detection. This feature allows multiplexing of the microcontroller analog inputs by sharing of sense resistance and ADC line among different devices.

**Figure 30. Current sense and diagnostic**

### 3.5 Maximum demagnetization energy ( $V_{CC} = 13.5$ V)

Figure 31. Maximum turn-off current versus inductance

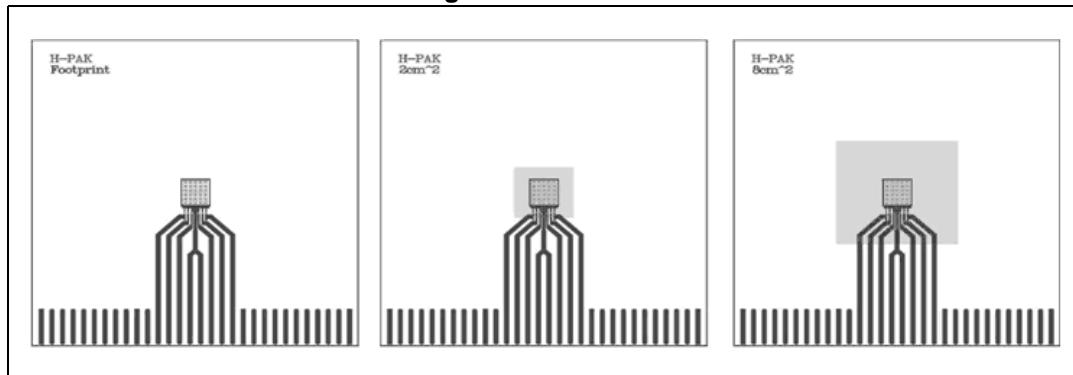

1. Values are generated with  $R_L = 0 \Omega$ . In case of repetitive pulses,  $T_{jstart}$  (at the beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

## 4 Package and PC board thermal data

### 4.1 HPak thermal data

Figure 32. PC board

1. Layout condition of  $R_{th}$  and  $Z_{th}$  measurements (PCB FR4 area = 58 mm x 58 mm, PCB thickness = 1.8 mm, Cu thickness = 70  $\mu$ m, Copper areas: from minimum pad lay-out to 8 cm<sup>2</sup>).

Figure 33.  $R_{thj-amb}$  vs PCB copper area in open box free air condition

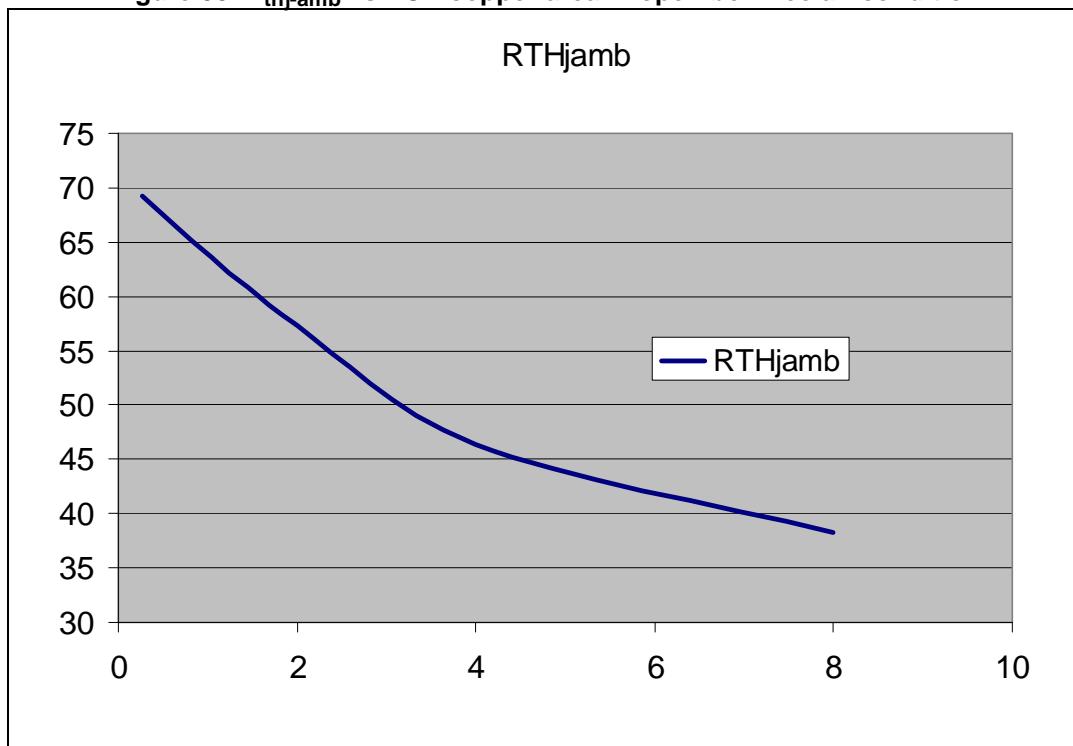

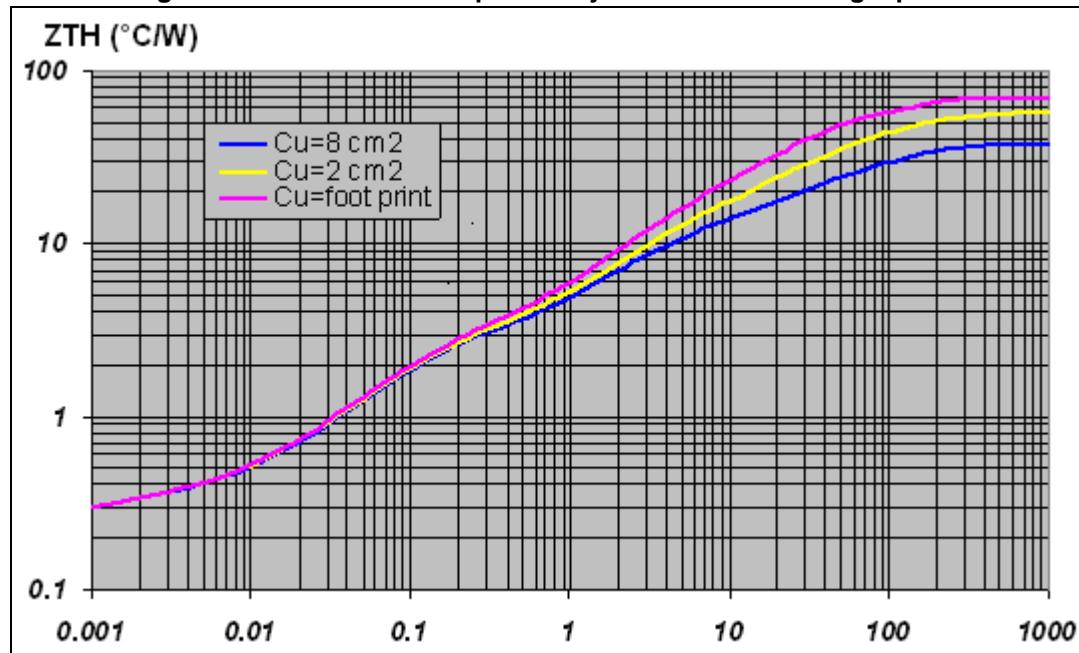

Figure 34. HPak thermal impedance junction ambient single pulse

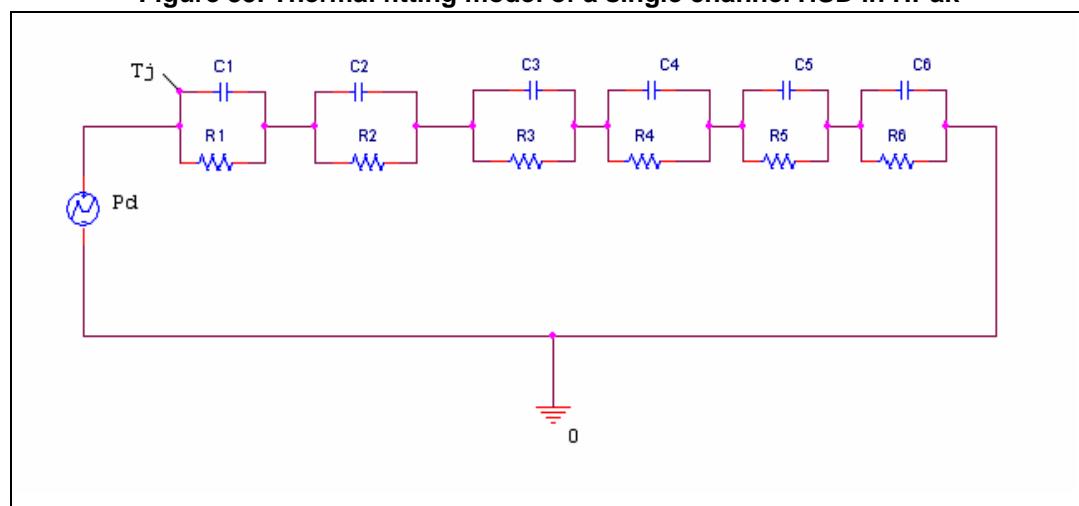

Equation 3: pulse calculation formula:

$$Z_{TH\delta} = R_{TH} \cdot \delta + Z_{THtp}(1 - \delta)$$

where  $\delta = t_p/T$

Figure 35. Thermal fitting model of a single channel HSD in HPak

1. The fitting model is a simplified thermal tool and is valid for transient evolutions where the embedded protections (power limitation or thermal cycling during thermal shutdown) are not triggered.

**Table 14. Thermal parameter**

| Area/island (cm <sup>2</sup> ) | Footprint | 4   | 8  |
|--------------------------------|-----------|-----|----|
| R1 (°C/W)                      | 0.1       | -   | -  |
