

# SP3508

## Rugged 3.3V, 20Mbps, 8 Channel Multiprotocol Transceiver with Programmable DCE/DTE and Termination Resistors

### FEATURES

- Fast 20Mbps Differential Transmission Rates
- Internal Transceiver Termination Resistors for V.11 & V.35
- Interface Modes:
  - RS-232 (V.28)      — EIA-530 (V.10 & V.11)
  - X.21 (V.11)      — EIA-530A (V.10 & V.11)
  - RS-449/V.36 (V.10 & V.11)      — V.35 (V.35 & V.28)
- Protocols are Software Selectable with 3-Bit Word
- Eight (8) Drivers and Eight (8) Receivers
- Termination Network Disable Option
- Internal Line or Digital Loopback for Diagnostic Testing
- Certified conformance to NET1/NET2 and TBR-1 TBR-2 by TUV Rheinland (TBR2/30451940.001/04)
- Easy Flow-Through Pinout
- +3.3V Only Operation
- Individual Driver and Receiver Enable/Disable Controls
- Operates in either DTE or DCE Mode

Now Available in Lead Free Packaging

Refer to page 9 for pinout

### APPLICATIONS

- Router
- Frame Relay
- CSU
- DSU
- PBX
- Secure Communication Terminals

### DESCRIPTION

The SP3508 is a monolithic device that supports eight (8) popular serial interface standards for Wide Area Network (WAN) connectivity. The SP3508 is fabricated using a low power BiCMOS process technology, and incorporates a regulated charge pump allowing +3.3V only operation. Exar's patented charge pump provides a regulated output of  $\pm 5.5V$ , which will provide enough voltage for compliant operation in all modes. Eight (8) drivers and eight (8) receivers can be configured via software for any of the above interface modes at any time. The SP3508 requires no additional external components for compliant operation for all of the eight (8) modes of operation other than six capacitors used for the internal charge pump. All necessary termination is integrated within the SP3508 and is switchable when V.35 drivers and V.35 receivers, or when V.11 receivers are used. The SP3508 provides the controls and transceiver availability for operating as either a DTE or DCE.

Additional features with the SP3508 include internal loopback that can be initiated in any of the operating modes by use of the `LOOPBACK` pin. While in loopback mode, receiver outputs are internally connected to driver inputs creating an internal signal path bypassing the serial communications controller for diagnostic testing. The SP3508 also includes a latch enable pin with the driver and receiver address decoder. The internal V.11 or V.35 termination can be switched off using a control pin (`TERM_OFF`) for monitoring applications. All eight (8) drivers and receivers in the SP3508 include separate enable pins for added convenience. The SP3508 is ideal for WAN serial ports in networking equipment such as routers, access concentrators, network muxes, DSU/CSU's, networking test equipment, and other access devices.

## ABSOLUTE MAXIMUM RATINGS

V <sub>CC</sub> .....	+7V
Input Voltages:	
Logic .....	-0.3V to (V <sub>CC</sub> +0.5V)
Drivers.....	-0.3V to (V <sub>CC</sub> +0.5V)
Receivers .....	±15.5V
Output Voltages:	
Logic .....	-0.3V to (V <sub>CC</sub> +0.5V)
Drivers.....	±12V
Receivers .....	-0.3V to (V <sub>CC</sub> +0.5V)
Storage Temperature.....	-65°C to +150°C
Power Dissipation.....	1520mW
(derate 19.0mW/°C above +70°C)	
Junction Temperature T <sub>J</sub> .....	+141°C

### Package Derating:

θ <sub>JA</sub> .....	36.9 °C/W
θ <sub>JC</sub> .....	6.5 °C/W

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

## STORAGE CONSIDERATIONS

Due to the relatively large package size of the 100-pin quad flat-pack, storage in a low humidity environment is preferred. Large high density plastic packages are moisture sensitive and should be stored in Dry Vapor Barrier Bags. Prior to usage, the parts should remain bagged and stored below 40°C and 60%RH. If the parts are removed from the bag, they should be

used within 48 hours or stored in an environment at or below 20%RH. If the above conditions cannot be followed, the parts should be baked for four hours at 125°C in order to remove moisture prior to soldering. Exar ships the 100-pin LQFP in Dry Vapor Barrier Bags with a humidity indicator card and desiccant pack. The humidity indicator should be below 30%RH.

## ELECTRICAL SPECIFICATIONS

T<sub>A</sub> = 0 to 70°C and V<sub>CC</sub> = 3.3V ± 5% unless otherwise noted. The ♦ denotes the specifications which apply over the full operating temperature range (-40°C to +85°C), unless otherwise specified.

PARAMETER	MIN.	TYP.	MAX.		UNITS	CONDITIONS
<b>LOGIC INPUTS</b>						
V <sub>IL</sub>			0.8	♦	V	
V <sub>IH</sub>	2.0			♦	V	
<b>LOGIC OUTPUTS</b>

Figure 44. Functional Diagram

The SP3508 contains highly integrated serial transceivers that offer programmability between interface modes through software control. The SP3508 offers the hardware interface modes for RS-232 (V.28), RS-449/V.36 (V.11 and V.10), EIA-530 (V.11 and V.10), EIA-530A (V.11 and V.10), V.35 (V.35 and V.28) and X.21(V.11). The interface mode selection is done via three control pins, which can be latched via microprocessor control.

The SP3508 has eight drivers, eight receivers, and a patented on-board charge pump (5,306,954) that is ideally suited for wide area network connectivity and other multi-protocol applications. Other features include digital and line loopback modes, individual enable/disable control lines for each driver and receiver, fail-safe when inputs are either open or shorted.

## THEORY OF OPERATION

The SP3508 device is made up of

- 1) the drivers
- 2) the receivers
- 3) charge pumps
- 4) DTE/DCE switching algorithm
- 5) control logic.

### Drivers

The SP3508 has eight enhanced independent drivers. Control for the mode selection is done via a three-bit control word into D0, D1, and D2. The drivers are prearranged such that for each mode of operation, the relative position and functionality of the drivers are set up to accommodate the selected interface mode. As the mode of the drivers is changed, the electrical characteristics will change to support the required signal levels. The mode of each driver in the different interface modes that can be selected is shown in Table 1.

There are four basic types of driver circuits – ITU-T-V.28 (RS-232), ITU-T-V.10 (RS-423), ITU-T-V.11 (RS-422), and CCITT-V.35.

The V.28 (RS-232) drivers output single-ended signals with a minimum of  $\pm 5V$  (with  $3k\Omega$  &  $2500pF$  loading), and can operate over 120kbps. Since the SP3508 uses a charge pump to generate the RS-232 output rails, the driver outputs will never exceed  $\pm 10V$ . The V.28 driver architecture is similar to Sipex's standard line of RS-232 transceivers.

The RS-423 (V.10) drivers are also single-ended signals which produce open circuit  $V_{OL}$  and  $V_{OH}$  measurements of  $\pm 4.0V$  to  $\pm 6.0V$ . When terminated with a  $450\Omega$  load to ground, the driver output will not deviate more than 10% of the open circuit value. This is in compliance of the ITU V.10 specification. The V.10 (RS-423) drivers are used in RS-449/V.36, EIA-530, and EIA-530A modes as Category II signals from each of their corresponding specifications. The V.10 driver can transmit over 120Kbps if necessary.

The third type of drivers are V.11 (RS-422) differential drivers. Due to the nature of differential signaling, the drivers are more immune to noise as opposed to single-ended transmission methods. The advantage is evident over high speeds and long transmission lines. The strength of the driver outputs can produce differential signals that can maintain  $\pm 2V$  differential output levels with a load of  $100\Omega$ . The strength allows the SP3508 differential driver to drive over long cable lengths with minimal signal degradation. The V.11 drivers are used in RS-449, EIA-530, EIA-530A and V.36 modes as Category I signals which are used for clock and data. Exar's new driver design over its predecessors allow the SP3508 to operate over 20Mbps for differential transmission.

The fourth type of drivers are V.35 differential drivers. There are only three available on the SP3508 for data and clock (TxD, TxCE, and TxC in DCE mode).

These drivers are current sources that drive loop current through a differential pair resulting in a 550mV differential voltage at the receiver. These drivers also incorporate fixed termination networks for each driver in order to set the  $V_{OH}$  and  $V_{OL}$  depending on load conditions. This termination network is basically a “Y” configuration consisting of two 51 $\Omega$  resistors connected in series and a 124 $\Omega$  resistor connected between the two 50 $\Omega$  resistors to GND. Filtering can be done on these pins to reduce common mode noise transmitted over the transmission line by connecting a capacitor to ground.

The drivers also have separate enable pins which simplifies half-duplex configurations for some applications, especially programmable DTE/DCE. The enable pins will either enable or disable the output of the drivers according to the appropriate active logic illustrated on Figure 44. The enable pins have internal pull-up and pull-down devices, depending on the active polarity of the receiver, that enable the driver upon power-on if the enable lines are left floating. During disabled conditions, the driver outputs will be at a high impedance 3-state.

The driver inputs are both TTL or CMOS compatible. All driver inputs have an internal pull-up resistor so that the output will be at a defined state at logic LOW (“0”). Unused driver inputs can be left floating. The internal pull-up resistor value is approximately 500k $\Omega$ .

### Receivers

The SP3508 has eight enhanced independent receivers. Control for the mode selection is done via a three-bit control word that is the same as the driver control word. Therefore, the modes for the drivers and receivers are identical in the application. Like the drivers, the receivers are prearranged for the specific requirements of the synchronous serial interface. As the operating mode of the receivers is changed, the electrical characteristics will change to support the required serial interface protocols of the receivers. Table 1 shows the mode of each receiver in the different

interface modes that can be selected. There are two basic types of receiver circuits—ITU-T-V.28 (RS-232) and ITU-T-V.11, (RS-422).

The RS-232 (V.28) receiver is single-ended and accepts RS-232 signals from the RS-232 driver. The RS-232 receiver has an operating input voltage range of  $\pm 15V$  and can receive signals down to  $\pm 3V$ . The input sensitivity complies with RS-232 and V.28 at  $\pm 3V$ . The input impedance is 3k $\Omega$  to 7k $\Omega$  in accordance to RS-232 and V.28. The receiver output produces a TTL/CMOS signal with a +2.4V minimum for a logic “1” and a +0.4V maximum for a logic “0”. The RS-232 (V.28) protocol uses these receivers for all data, clock and control signals. They are also used in V.35 mode for control line signals: CTS, DSR, LL, and RL. The RS-232 receivers can operate over 120kbps.

The second type of receiver is a differential type that can be configured internally to support ITU-T-V.10 and CCITT-V.35 depending on its input conditions. This receiver has a typical input impedance of 10k $\Omega$  and a differential threshold of less than  $\pm 200mV$ , which complies with the ITU-T-V.11 (RS-422) specifications. V.11 receivers are used in RS-449/V.36, EIA-530, EIA-530A and X.21 as Category I signals for receiving clock, data, and some control line signals not covered by Category II V.10 circuits. The differential V.11 transceiver has improved architecture that allows over 20Mbps transmission rates.

Receivers dedicated for data and clock (RxD, RxC, Tx) incorporate internal termination for V.11. The termination resistor is typically 120 $\Omega$  connected between the A and B inputs. The termination is essential for minimizing crosstalk and signal reflection over the transmission line. The minimum value is guaranteed to exceed 100 $\Omega$ , thus complying with the V.11 and RS-422 specifications. This resistor is invoked when the receiver is operating as a V.11 receiver, in modes EIA-530, EIA-530A, RS-449/V.36, and X.21.

The same receivers also incorporate a termination network internally for V.35 applications. For V.35, the receiver input termination is a “Y” termination consisting of two 51Ω resistors connected in series and a 124Ω resistor connected between the two 50Ω resistors and GND. The receiver itself is identical to the V.11 receiver.

The differential receivers can be configured to be ITU-T-V.10 single-ended receivers by internally connecting the non-inverting input to ground. This is internally done by default from the decoder. The non-inverting input is rerouted to V10GND and can be grounded separately. The ITU-T-V.10 receivers can operate over 120Kbps and are used in RS-449/V.36, E1A-530, E1A-530A and X.21 modes as Category II signals as indicated by their corresponding specifications. All receivers include an enable/disable line for disabling the receiver output allowing convenient half-duplex configurations. The enable pins will either enable or disable the output of the receivers according to the appropriate active logic illustrated on Figure 44. The receiver’s enable lines include an internal pull-up or pull-down device, depending on the active polarity of the receiver, that enables the receiver upon power up if the enable lines are left floating. During disabled conditions, the receiver outputs will be at a high impedance state. If the receiver is disabled any associated termination is also disconnected from the inputs.

All receivers include a fail-safe feature that outputs a logic high when the receiver inputs

are open, terminated but open, or shorted together. For single-ended V.28 and V.10 receivers, there are internal 5kΩ pull-down resistors on the inputs which produces a logic high (“1”) at the receiver outputs. The differential receivers have a proprietary circuit that detect open or shorted inputs and if so, will produce a logic HIGH (“1”) at the receiver output.

### CHARGE PUMP

SP3508 uses an internal capacitive charge pump to generate V<sub>DD</sub> and V<sub>SS</sub>. The design is a patented (5,306,954) four-phased voltage shifting charge pump converters that converts the input voltage of 3.3V to nominal output voltages of +/-6V (V<sub>DD</sub> & V<sub>SS1</sub>). SP3508 also includes an inverter block that inverts V<sub>CC</sub> to -V<sub>CC</sub> (V<sub>SS2</sub>). There is a free-running oscillator that controls the four phases of the voltage shifting. A description of each phase follows.

### 4-phased doubler pump

#### Phase 1

-V<sub>SS1</sub> charge storage -During this phase of the clock cycle, the positive side of capacitors C1 and C2 are initially charged to V<sub>CC</sub>. C1+ is then switched to ground and the charge in C1- is transferred to C2-. Since C2+ is connected to V<sub>CC</sub>, the voltage potential across capacitor C2 is now 2xV<sub>CC</sub>.

Figure 45. Charge Pump - Phase 1.

### Phase 2

$-V_{SS1}$  transfer -Phase two of the clock connects the negative terminal of C2 to the  $V_{SS1}$  storage capacitor and the positive terminal of C2 to ground, and transfers the negative generated voltage to  $C_{VSS1}$ . This generated voltage is regulated to  $-5.5V$ . Simultaneously, the positive side of the capacitor C1 is switched to  $V_{CC}$  and the negative side is connected to ground.

Figure 46. Charge Pump - Phase 2.

### Phase 3

$-V_{DD}$  charge storage -The third phase of the clock is identical to the first phase-the charge transferred in C1 produces  $-V_{CC}$  in the negative terminal of C1 which is applied to the negative side of the capacitor C2. Since C2+ is at  $V_{CC}$ , the voltage potential across C2 is  $2xV_{CC}$ .

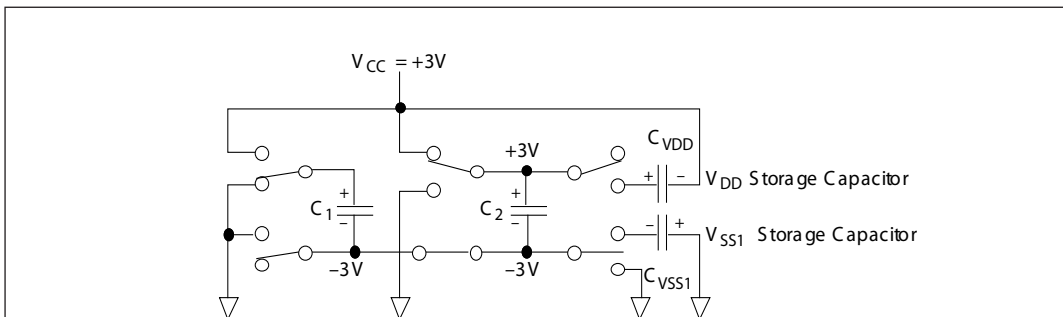

Figure 47. Charge Pump - Phase 3.

### Phase 4

$-V_{DD}$  transfer -The fourth phase of the clock connects the negative terminal of C2 to ground, and transfers the generated  $5.5V$  across C2 to  $C_{VDD}$ , the  $V_{DD}$  storage capacitor. This voltage is regulated to  $+5.5V$ . At the regulated voltage, the internal oscillator is disabled and simultaneously with this, the positive side of capacitor C1 is switched to  $V_{CC}$  and the negative side is connected to ground, and the cycle begins again. The charge pump cycle will continue as long as the operational conditions for the internal oscillator are present. Since both  $V+$  and  $V-$  are separately generated from  $V_{CC}$ ; in a no-load condition  $V+$  and  $V-$  will be symmetrical. Older charge pump approaches that generate  $V-$  from  $V+$  will show a decrease in the magnitude of  $V-$  compared to  $V+$  due to the inherent inefficiencies in the design. The clock rate for the charge pump typically operates at  $250kHz$ . The external capacitors can be as low as  $1\mu F$  with a  $16V$  breakdown voltage rating.

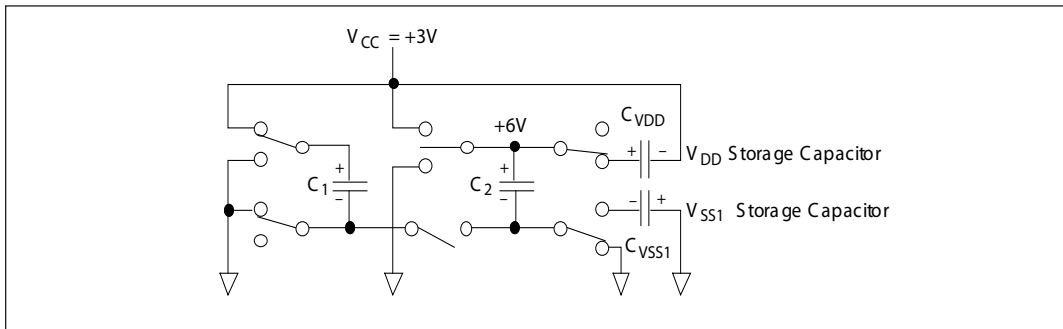

Figure 48. Charge Pump - Phase 4.

## 2-phased inverter pump

### Phase 1

Please refer to figure below: In the first phase of the clock cycle, switches S2 and S4 are opened and S1 and S3 closed. This connects the flying capacitor, C3, from  $V_{in}$  to ground. C3 charge up to the input voltage applied at  $V_{CC}$ .

### Phase 2

In the second phase of the clock cycle, switches S2 and S4 are closed and S1 and S3 are opened. This connects the flying capacitor, C3, in parallel with the output capacitor,  $C_{VSS2}$ . The Charge stored in C3 is now transferred to  $C_{VSS2}$ . Simultaneously, the negative side of  $C_{VSS2}$  is connected to  $V_{SS2}$  and the positive side is connected to ground. With the voltage across  $C_{VSS2}$  smaller than the voltage across C3, the charge flows from C3 to  $C_{VSS2}$  until the voltage at the  $V_{SS2}$  equals  $-V_{CC}$ .

V.28	TM	25	V.10					V.28	142	NN			

Spare drivers and receivers may be used for optional signals (Signal Quality, Rate Detect, Standby) or may be disabled using individual enable pins for each driver and receiver

Pin assignments and signal functions are subject to national or regional variation and proprietary / non-standard implementations

\*\* X.21 use either B() or X(), not both

### **TERM\_OFF FUNCTION**

The SP3508 contains a TERM\_OFF pin that disables all three receiver input termination networks regardless of mode. This allows the device to be used in monitor mode applications typically found in networking test equipment.

The TERM\_OFF pin internally contains a pull-down device with an impedance of over 500k $\Omega$ , which will default in a "ON" condition during power-up if V.35 receivers enable line and the SHUTDOWN mode from the decoder will disable the termination regardless of TERM\_OFF.

### **LOOPBACK FUNCTION**

The SP3508 contains a LOOPBACK pin that invokes a loopback path. This loopback path is illustrated in Figure 50. LOOPBACK has an internal pull-up resistor that defaults to normal mode during power up or if the pin is left floating. During loopback, the driver output and receiver input characteristics will still adhere to its appropriate specifications.

### **DECODER AND D\_LATCH FUNCTION**

The SP3508 contains a D\_LATCH pin that latches the data into the D0, D1 and D2 decoder inputs. If tied to a logic LOW ("0"), the latch is transparent, allowing the data at the decoder inputs to propagate through and program the SP3508 accordingly. If tied to a logic HIGH ("1"), the latch locks out the data and prevents the mode from changing until this pin is brought to a logic LOW.

There are internal pull-up devices on D0, D1 and D2, which allow the device to be in SHUTDOWN mode ("111") upon power up. However, if the device is powered-up with the D\_LATCH at a logic HIGH, the decoder state of the SP3508 will be undefined.

### **CTR1/CTR2 EUROPEAN COMPLIANCY**

As with all of Exar's previous multi-protocol serial transceiver IC's the drivers and receivers have been designed to meet all the requirements to NET1/NET2 and TBR2 in order to meet CTR1/CTR2 compliancy. The SP3508 is also tested in-house at Exar and adheres to all the NET1/2 physical layer testing and the ITU Series V specifications before shipment. Please note that although the SP3508, as with its predecessors, adhere to CRT1/CTR2 compliancy testing, any complex or usual configuration should be double-checked to ensure CTR1/CTR2 compliance. Consult the factory for details.

REVISION HISTORY			
REV	DESCRIPTION	DATE	APP'D
A	DRAWING ORIGINATOR	05/03/06	JL
B	CHANGE DRAWING LOGO AND COMPANY NAME	11/21/07	JL

		<b>EXAR CORPORATION</b> <small>Powering Connectivity</small>	
Packaging Approval:	11/21/07	Drawing No.:	100-PIN LQFP
By: JL	Date:	Revision:	B
		Sheet:	1 OF 1
100 PIN LQFP PACKAGE OUTLINE			

Part Number	Temperature Range	Package Types
SP3508CF-L.....	0°C to +70°C .....	100-pin JEDEC LQFP
SP3508EF-L.....	-40°C to +85°C .....	100-pin JEDEC LQFP

**REVISION HISTORY**

Date	Revision	Description
1/12/04	A	Implemented Tracking revision
2/27/04	B	Included Diamond column in spec table indicating which specs apply over full operating temperature range. Correct typo to Fig. 51 pin 61 and 62.
3/31/04	C	Corrected max dimension for symbol c on LQFP package outline
6/03/04	D	Added table to page 27 and 28
10/12/04	E	Certified conformance to NET1/NET2 and TBR-1/TBR-2 TUV by TUV Rheinland (Test report # TBR2/30451940.001/04)
10/29/04	F	Corrected V.28 Driver Open circuit values, pages 27 and 28 -- both for DCE and DTE that BA(B) should connect to pin 14.
7/17/08	1.0.0	Change Revision format from letter code to number code. Change Logo, footnote and notice statement from Sipex to Exar. Add T <sub>j</sub> limits to Absolute Maximum Ratings. Change propagation delay limit specification for V.11 and V.35 Driver/Receiver from 60ns Maximum to 85ns Maximum. Update ordering information to show only RoHS packaging (-L) is available.
