

## Features

- Output voltage tolerance  $\leq \pm 2\%$
- Very low current consumption
- Low-drop voltage
- Watchdog
- Settable reset threshold
- Overtemperature protection
- Reverse polarity protection
- Short-circuit proof
- Suitable for use in automotive electronics
- Wide temperature range
- Green Product (RoHS compliant)
- AEC Qualified

## Functional Description

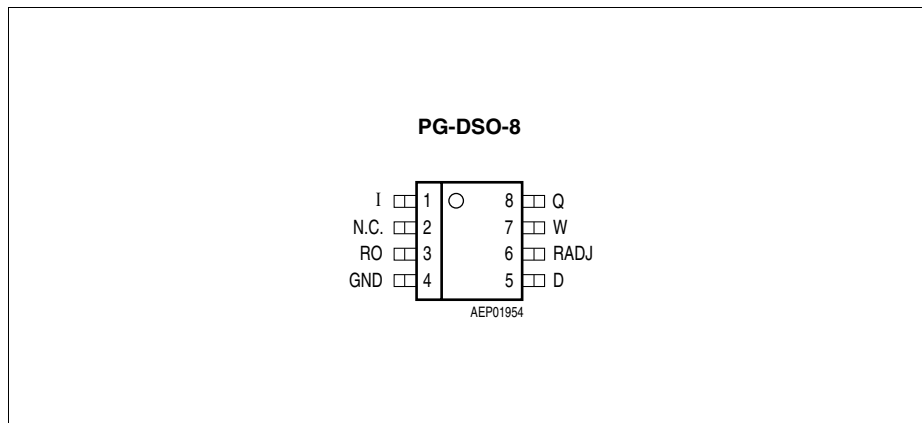

This device is a 5-V low-drop fixed-voltage regulator. The maximum input voltage is 45 V. It can deliver an output current of at least 180 mA. The IC is short-circuit proof and features temperature protection that disables the circuit in the event of impermissibly high temperatures. The watchdog function is disabled as a function of the load, so that a controller is not interrupted during sleep mode by a watchdog reset.

## Application Description

The IC regulates an input voltage  $V_I$  in the range  $5.5 \text{ V} < V_I < 45 \text{ V}$  to  $V_{Q, \text{nom}} = 5.0 \text{ V}$ . In the event of an output voltage  $V_Q < V_{RT}$ , a reset signal is generated. The wiring of the reset switching threshold input enables the value of  $V_{RT}$  to be reduced. The reset delay time can be adjusted using an external capacitor. The integrated watchdog monitors the connected active controller. If there is no rising edge at the watchdog input, the reset

Type	Package
TLE 4268 GS	PG-DSO-8
TLE 4268 G	PG-DSO-20

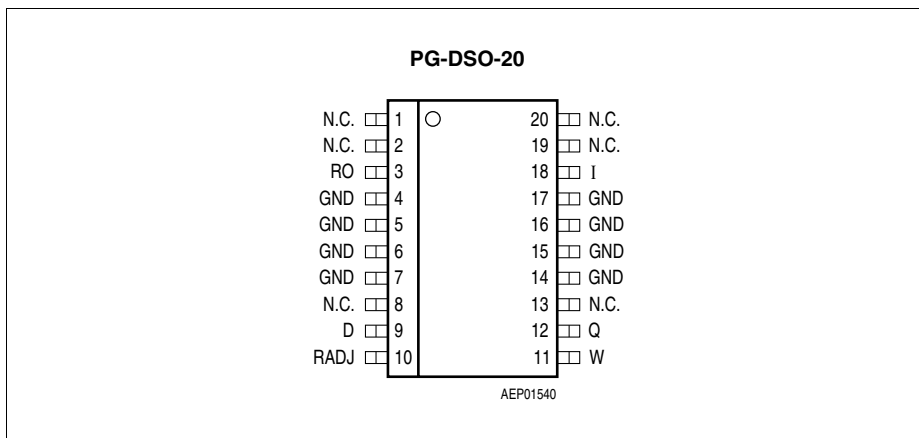

output is set to low. The reset delay capacitor provides a wide adjustment range for the pulse repetition time. The watchdog function is only activated if the load exceeds 8 mA. This ensures that a microcontroller is not activated during power-down and the current drain is not increased. The IC is protected against overload and overtemperature.

**Figure 1**      **Pin Configuration** (top view)

**Table 1**      **Pin Definitions and Functions**

Pin	Symbol	Function
1	I	Input voltage
2	N.C.	Not connected
3	RO	Reset output
4	GND	Ground
5	D	Reset delay
6	RADJ	Reset switching threshold
7	W	Watchdog input
8	Q	5 V output voltage

**Figure 2** Pin Configuration (top view)

**Table 2** Pin Definitions and Functions

Pin	Symbol	Function
1, 2, 8, 13, 19, 20	N.C.	Not connected.
3	RO	<b>Reset output</b> ; the open collector output is connected to the 5-V output via an integrated resistor of 30 k $\Omega$ .
4 ... 7, 14 ... 17	GND	<b>Ground</b>
9	D	<b>Reset delay</b> ; connect a capacitor to ground for delay time adjustment.
10	RADJ	<b>Reset switching threshold</b> ; for setting the switching threshold, output to ground with voltage divider. If this input is connected to ground, the reset is triggered at an output voltage of 4.5 V.
11	W	<b>Watchdog input</b> ; positive-edge-triggered input for monitoring a microcontroller.
12	Q	<b>5-V output voltage</b> ; block to ground with 22 $\mu$ F capacitor, ESR < 3 $\Omega$ .
18	I	<b>Input voltage</b> ; block to ground directly on the IC with ceramic capacitor.

**Table 3 Absolute Maximum Ratings**

Parameter	Symbol	Limit Values		Unit	Notes
		Min.	Max.

1) Package mounted on PCB  $80 \times 80 \times 1.5 \text{ mm}^3$ ;  $35\mu \text{ Cu}$ ;  $5\mu \text{ Sn}$ ; Footprint only; zero airflow.

2) Measured to pin 2.

3) Measured to pin 5.

Optimum reliability and life time are guaranteed if the junction temperature does not exceed 125 °C in operating mode. Operation at up to the maximum junction temperature of 150 °C is possible in principle. Note, however, operation at the maximum permitted ratings could affect the reliability of the device.

**Table 5 Characteristics**
 $V_I = 13.5 \text{ V}; -40 \text{ }^{\circ}\text{C} \leq T_j \leq 125 \text{ }^{\circ}\text{C}$  (unless otherwise specified)

Activating current	$I_Q$	2	8	15	mA	Activates watchdog
Slew rate	$dV_W/dt$	5	–	–	V/μs	from 20% up to 80% $V_Q^{(2)}$

1) Drop voltage =  $V_I - V_Q$  (measured when the output voltage has dropped 100 mV from the nominal value obtained at 13.5 V input)

2) Watchdog pulse recognition tested with 10 kHz max. pulse frequency

*Note: The reset output is low in range from  $V_Q = 1 \text{ V}$  to  $V_{Q,rt}$ .*

**Figure 4**      **Test Circuit**

## Reset Timing

The power-on reset delay time is defined by the charging time of an external capacitor  $C_D$  which can be calculated as follows:

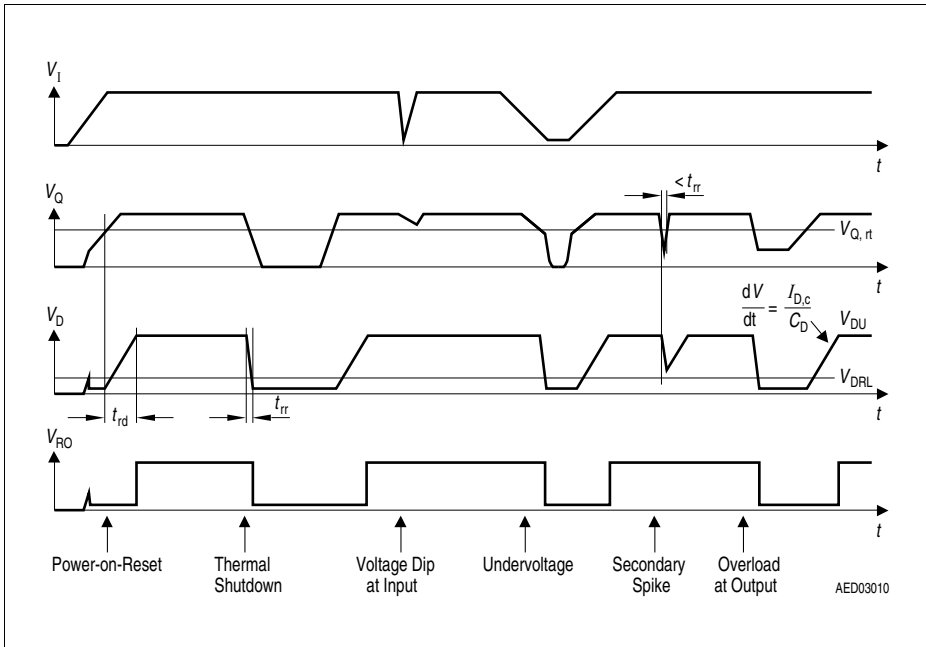

$$C_D = (\Delta t_{rd} \times I_{D,c}) / \Delta V \quad (1)$$

Definitions:

- $C_D$  = delay capacitor
- $\Delta t_{rd}$  = delay time
- $I_{D,c}$  = charge current, typical 12  $\mu$ A
- $\Delta V = V_{DU}$ , typical 1.8 V
- $V_{DU}$  = upper delay switching threshold at  $C_D$  for reset delay time

The reset reaction time  $t_{rr}$  is the time it takes the voltage regulator to set the reset out LOW after the output voltage has dropped below the reset threshold. It is typically 1  $\mu$ s for delay capacitor of 47 nF. For other values for  $C_D$  the reaction time can be estimated using the following equation:

$$t_{rr} \approx 20 \text{ s/F} \times C_D \quad (2)$$

## Package Outlines

**Figure 7 PG-DSO-8 (Plastic Dual Small Outline)**

### Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

You can find all of our packages, sorts of packing and others in our Infineon Internet Page "Products": <http://www.infineon.com/products>.
