

## ADJUSTABLE LOW DROPOUT VOLTAGE REGULATOR

### ■ GENERAL DESCRIPTION

The NJM2387/89 are adjustable low dropout voltage regulators. The output current is up to 1.0A and dropout voltage is 0.2V typ. at  $I_o=0.5A$ . NJM2387 has ON/OFF control circuit and enable to reduce quiescent current. The NJM2387/89 are suitable for power module, TV, Display, car stereo and low power applications.

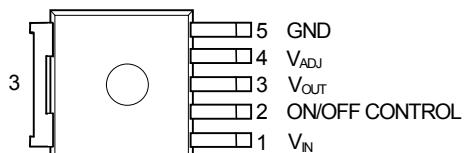

### ■ PACKAGE OUTLINE

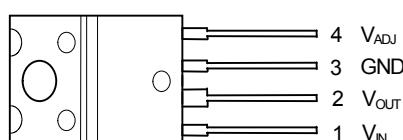

### ■ FEATURES

- Low Dropout Voltage       $\Delta V_{I_O}=0.2V$  typ. at  $I_o=0.5A$
- Output Current       $I_o(\max.)=1.0A$
- Reference Voltage       $V_{ref}=1.26V \pm 2\%$
- ON/OFF Control      (Active High : Only NJM2387)
- Internal Short Circuit Current Limit
- Internal Overvoltage Protection
- Internal Thermal Overload Protection
- Bipolar Technology
- Package Outline      TO-252-5(NJM2387), TO-220F-4(NJM2389)

## ■ TYPICAL APPLICATION

- ① In the case where ON/OFF Control is not required:

Connect control pin to  $V_{IN}$  pin or open.

- ② In use of ON/OFF CONTROL:

State of control pin:

- "H" or "open" → output is enabled.
- "L" → output is disabled.

## \*Feed back Resistance R1

The output voltage may rise against the set point by the leak current from the  $V_{OUT}$  pin at high temperature when this resistance is set too big.

Conversely, the current flowing to R1 grows big when R1 is set too small, and make the consumption current increase.

From the above, recommend  $100\Omega$  to  $20k\Omega$  as a set range of R1.

## \*Input Capacitor $C_{IN}$

Input Capacitor  $C_{IN}$  is required to prevent oscillation and reduce power supply ripple for applications when high power supply impedance or a long power supply line.

Therefore, use the recommended  $C_{IN}$  value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and  $V_{IN}$  as shortest path as possible to avoid the problem.

## \*Output Capacitor $C_O$

Output capacitor ( $C_O$ ) will be required for a phase compensation of the internal error amplifier.

The capacitance and the equivalent series resistance (ESR) influence to stable operation of the regulator.

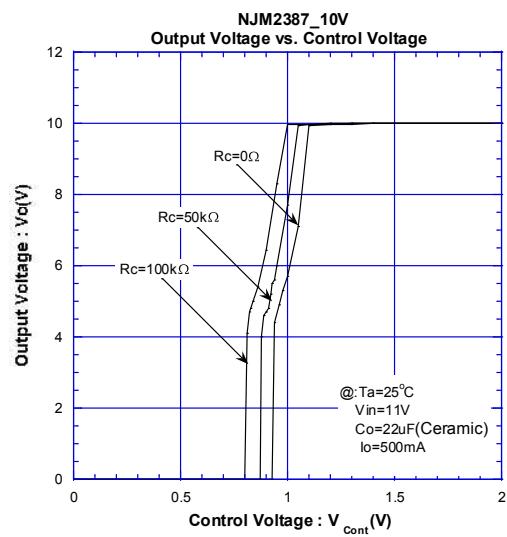

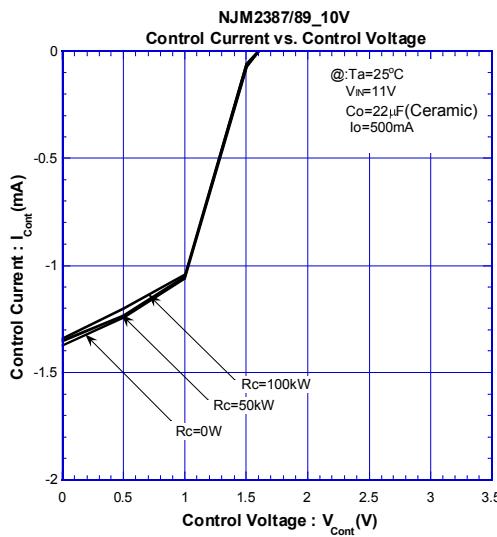

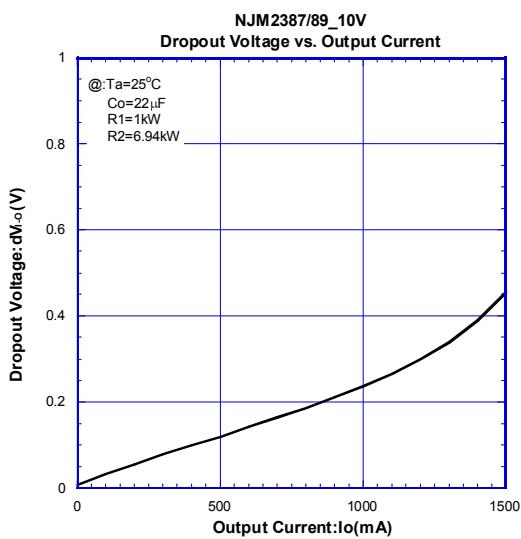

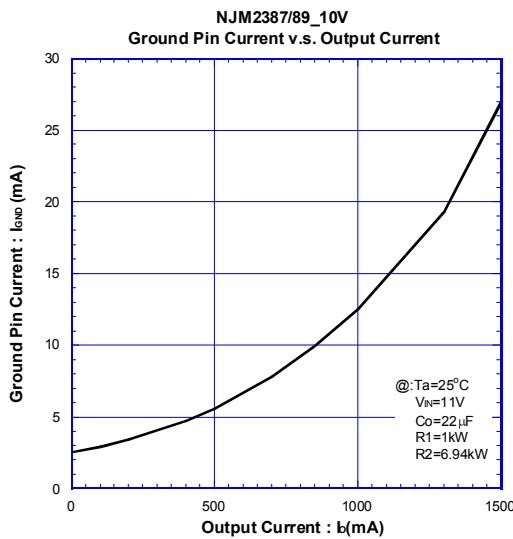

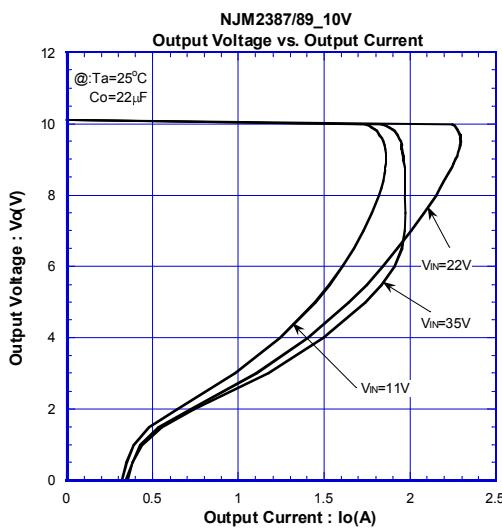

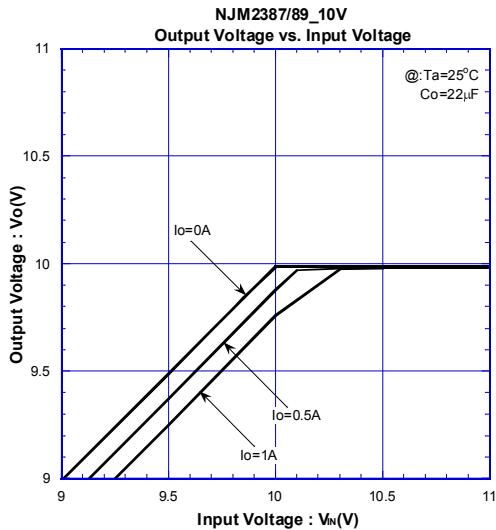

Use of a smaller  $C_O$  may cause excess output noise or oscillation of the regulator due to lack of the phase compensation.

On the other hand, Use of a larger  $C_O$  reduces output noise and ripple output, and also improves output transient response when rapid load change.

Therefore, use the recommended  $C_O$  value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and  $V_{OUT}$  as shortest path as possible for stable operation

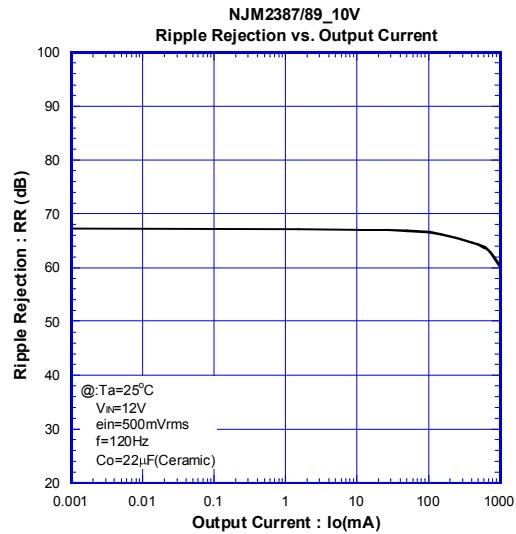

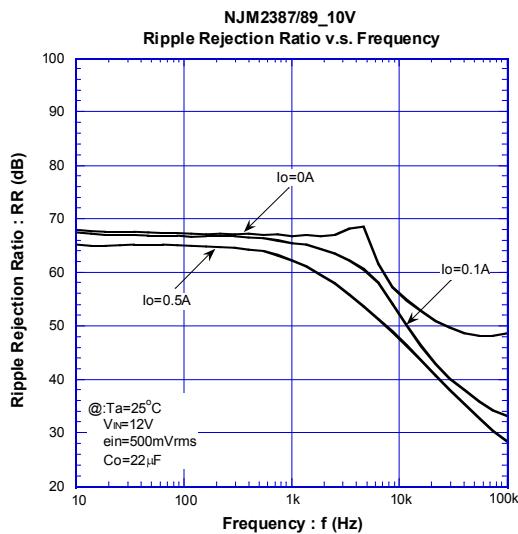

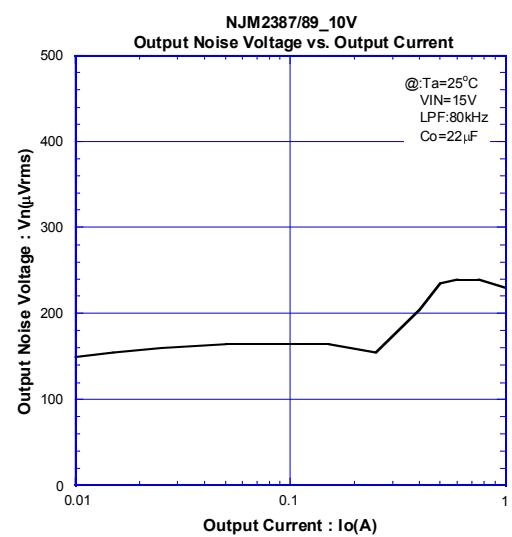

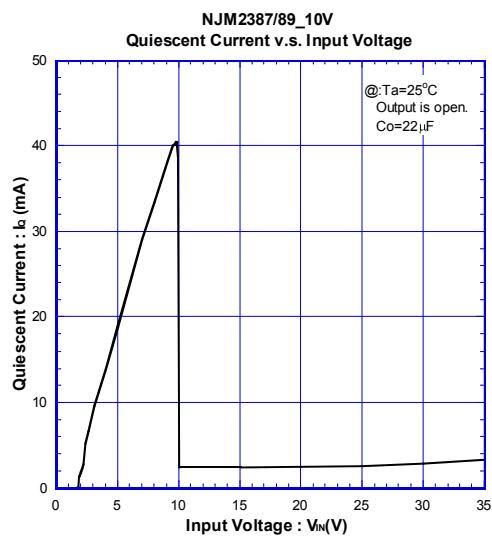

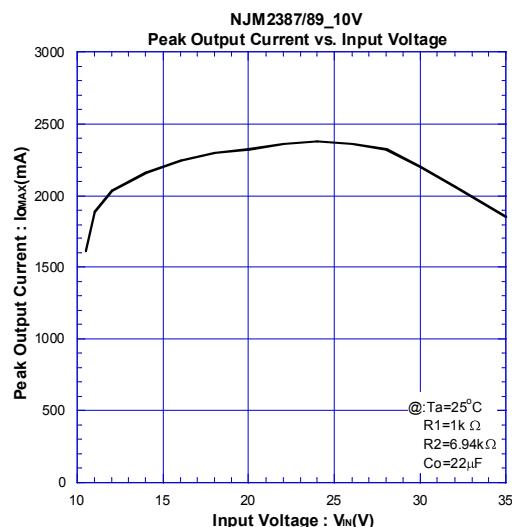

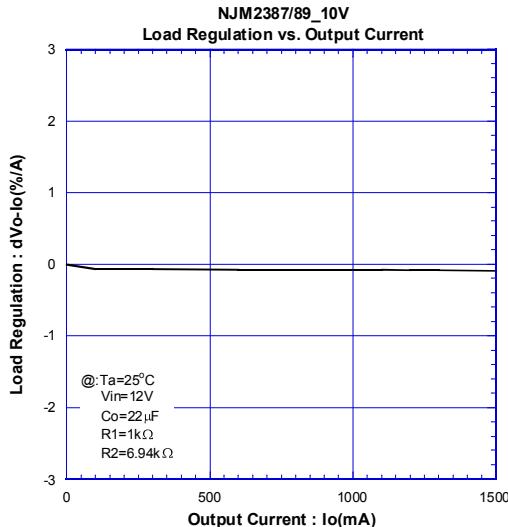

In addition, Please choose an appropriate capacitor in considering varied characteristics of capacitor (a frequency characteristic, a temperature characteristic, and so on) when selecting  $C_O$ .
