

VERY LOW POWER, NEGATIVE RAIL INPUT, RAIL-TO-RAIL OUTPUT, FULLY DIFFERENTIAL AMPLIFIER

Check for Samples: [THS4524-EP](#)

FEATURES

- Fully Differential Architecture
- Bandwidth: 145 MHz
- Slew Rate: 490 V/μs
- HD₂: -133 dBc at 10 kHz (1 V_{RMS}, R_L = 1 kΩ)
- HD₃: -140 dBc at 10 kHz (1 V_{RMS}, R_L = 1 kΩ)
- Input Voltage Noise: 4.6 nV/√Hz (f = 100 kHz)
- THD+N: -112dBc (0.00025%) at 1 kHz (22-kHz BW, G = 1, 5 V_{PP})
- Open-Loop Gain: 119 dB
- NRI—Negative Rail Input
- RRO—Rail-to-Rail Output
- Output Common-Mode Control (With Low Offset and Drift)
- Power Supply:
 - Voltage: +2.5 V (±1.25 V) to +5.5 V (±2.75 V)
 - Current: 1.14 mA/ch
- Power-Down Capability: 20 μA (Typical)

APPLICATIONS

- Low-Power SAR and ΔΣ ADC Drivers
- Low-Power Differential Drivers
- Low-Power Differential Signal Conditioning
- Low-Power, High-Performance Differential Audio Amplifiers

SUPPORTS DEFENSE, AEROSPACE, AND MEDICAL APPLICATIONS

- Controlled Baseline
- One Assembly/Test Site
- One Fabrication Site
- Available in Military (-55°C/125°C) Temperature Range ⁽¹⁾
- Extended Product Life Cycle
- Extended Product-Change Notification
- Product Traceability

DESCRIPTION

The THS4524 is a very low-power, fully differential operational amplifier with rail-to-rail output and an input common-mode range that includes the negative rail. This amplifier is designed for low-power data acquisition systems and high-density applications where power dissipation is a critical parameter, and provide exceptional performance in audio applications.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

I²S is a trademark of NXP Semiconductor.

All other trademarks are the property of their respective owners.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

THS4524-EP

SBOS609A – JUNE 2012 – REVISED AUGUST 2013

www.ti.com

This fully differential op amp features accurate output common-mode control that allows for dc-coupling when driving analog-to-digital converters (ADCs). This control, coupled with an input common-mode range below the negative rail as well as rail-to-rail output, allows for easy interfacing between single-ended, ground-referenced signal sources. Additionally, the THS4524 is ideally suited for driving both successive-approximation register (SAR) and delta-sigma ($\Delta\Sigma$) ADCs using only a single +2.5-V to +5-V and ground power supply.

The THS4524 fully differential op amp is characterized for operation over the full industrial temperature range from -55°C to 125°C .

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

	Machine Model (MM)	50	V

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

THERMAL INFORMATION

THERMAL METRIC ⁽¹⁾		THS4524	UNITS
		DBT	
		38 PINS	
θ_{JA}	Junction-to-ambient thermal resistance ⁽²⁾	106.9	°C/W
θ_{JCTop}	Junction-to-case (top) thermal resistance ⁽³⁾	59.8	
θ_{JB}	Junction-to-board thermal resistance ⁽⁴⁾	66.5	
ψ_{JT}	Junction-to-top characterization parameter ⁽⁵⁾	17.1	
ψ_{JB}	Junction-to-board characterization parameter ⁽⁶⁾	66.1	
θ_{JCbott}	Junction-to-case (bottom) thermal resistance ⁽⁷⁾	N/A	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter, ψ_{JT} , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA} , using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter, ψ_{JB} , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA} , using a procedure described in JESD51-2a (sections 6 and 7).
- (7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

ELECTRICAL CHARACTERISTICS: $V_{S+} - V_{S-} = 3.3\text{ V}$

At $V_{S+} = +3.3\text{ V}$, $V_{S-} = 0\text{ V}$, $V_{OCM} = \text{open}$, $V_{OUT} = 2\text{ V}_{PP}$ (differential), $R_L = 1\text{ k}\Omega$ differential, $G = 1\text{ V/V}$, single-ended input, differential output, and input and output referenced to midsupply, unless otherwise noted.

PARAMETER	CONDITIONS	$T_A = -55^\circ\text{C to } 125^\circ\text{C}$			UNIT	TEST LEVEL ⁽¹⁾
		MIN	TYP	MAX		
AC PERFORMANCE						
Small-Signal Bandwidth	$V_{OUT} = 100\text{ mV}_{PP}$, $G = 1$		135		MHz	C
	$V_{OUT} = 100\text{ mV}_{PP}$, $G = 2$		49		MHz	C
	$V_{OUT} = 100\text{ mV}_{PP}$, $G = 5$		18.6		MHz	C
	$V_{OUT} = 100\text{ mV}_{PP}$, $G = 10$		9.3		MHz	C
Gain Bandwidth Product	$V_{OUT} = 100\text{ mV}_{PP}$, $G = 10$		93		MHz	C
Large-Signal Bandwidth	$V_{OUT} = 2\text{ V}_{PP}$, $G = 1$		95		MHz	C
Bandwidth for 0.1-dB Flatness	$V_{OUT} = 2\text{ V}_{PP}$, $G = 1$		20		MHz	C
Rising Slew Rate (Differential)	$V_{OUT} = 2\text{-V Step}$, $G = 1$, $R_L = 200\ \Omega$		420		V/ μs	C

DEVICE INFORMATION
**TSSOP-38 (DBT PACKAGE)
(TOP VIEW)**

TERMINAL FUNCTIONS

TSSOP-38		DESCRIPTION
PIN NO.	NAME	
1	$\overline{\text{PD}}_1$	Power down 1. $\overline{\text{PD}}$ = logic low puts channel into low-power mode. $\overline{\text{PD}}$ = logic high or open for normal operation.
2	$V_{\text{IN}1+}$	Noninverting amplifier 1 input
3	$V_{\text{IN}1-}$	Inverting amplifier 1 input
4	$V_{\text{OCM}1}$	Common-mode voltage input 1
5	$V_{\text{S}-}$	Negative power-supply input. Note that $V_{\text{S}-}$ is tied together on multi-channel devices.

Figure 52.

Figure 53.

Distortion

The circuit shown in [Figure 55](#) is used to measure harmonic and intermodulation distortion of the amplifier.

An HP signal generator is used as the signal source and the output is measured with a Rhode and Schwarz spectrum analyzer. The output impedance of the HP signal generator is ac-coupled and is 50 Ω. R_{IT} and R_G are chosen to impedance match to 50 Ω and maintain the proper gain. To balance the amplifier, a 0.22-μF capacitor and 49.9-Ω resistor to ground are inserted across R_{IT} on the alternate input.

A low-pass filter is inserted in series with the input to reduce harmonics generated at the signal source. The level of the fundamental is measured and then a high-pass filter is inserted at the output to reduce the fundamental so it does not generate distortion in the input of the spectrum analyzer.

The transformer used in the output to convert the signal from differential to single-ended is an ADT1-1WT. It limits the frequency response of the circuit so that measurements cannot be made below approximately 1 MHz.

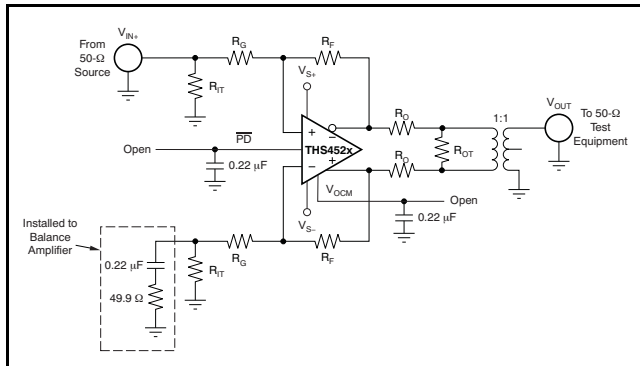

Figure 55. Distortion Test Circuit

Slew Rate, Transient Response, Settling Time, Output Impedance, Overdrive, Output Voltage, and Turn-On/Turn-Off Time

The circuit shown in [Figure 56](#) is used to measure slew rate, transient response, settling time, output impedance, overdrive recovery, output voltage swing, and amplifier turn-on/turn-off time. Turn-on and turn-off time are measured with the same circuit modified for 50-Ω input impedance on the PD input by replacing the 0.22-μF capacitor with a 49.9-Ω resistor. For output impedance, the signal is injected at V_{OUT} with V_{IN} open; the drop across the 2x 49.9-Ω resistors is then used to calculate the impedance seen looking into the amplifier output.

Figure 56. Slew Rate, Transient Response, Settling Time, Output Impedance, Overdrive Recovery, V_{OUT} Swing, and Turn-On/Turn-Off Test Circuit

Common-Mode and Power-Supply Rejection

The circuit shown in Figure 57 is used to measure the CMRR. The signal from the network analyzer is applied common-mode to the input. Figure 58 is used to measure the PSRR of V_{S+} and V_{S-} . The power supply under test is applied to the network analyzer dc offset input. For both CMRR and PSRR, the output is probed using a Tektronix high-impedance differential probe across the 953- Ω resistor and referred to the amplifier output by adding back the 0.42-dB as a result of the voltage divider on the output. For these tests, the resistors are matched for best results.

Figure 57. CMRR Test Circuit

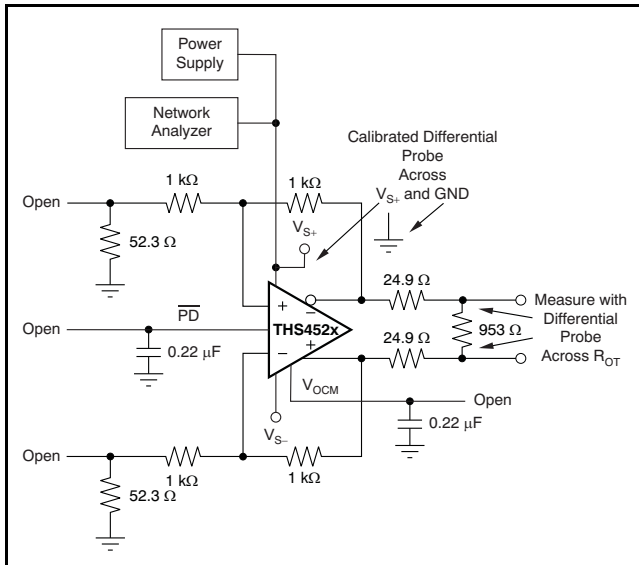

Figure 58. PSRR Test Circuit

V_{OCM} Input

The circuit illustrated in Figure 59 is used to measure the frequency response and input impedance of the V_{OCM} input. Frequency response is measured using a Tektronix high-impedance differential probe, with $R_{CM} = 0 \Omega$ at the common point of V_{OUT+} and V_{OUT-} , formed at the summing junction of the two matched 499- Ω resistors, with respect to ground. The input impedance is measured using a Tektronix high-impedance differential probe at the V_{OCM} input with $R_{CM} = 10 \text{ k}\Omega$ and the drop across the 10-k Ω resistor is used to calculate the impedance seen looking into the amplifier V_{OCM} input.

The circuit shown in Figure 60 measures the transient response and slew rate of the V_{OCM} input. A 1-V step input is applied to the V_{OCM} input and the output is measured using a 50- Ω oscilloscope input referenced back to the amplifier output.

Figure 59. V_{OCM} Input Test Circuit

Figure 60. V_{OCM} Transient Response and Slew Rate Test Circuit

APPLICATION INFORMATION

The following circuits show application information for the THS4524. For simplicity, power-supply decoupling capacitors are not shown in these diagrams; see the [EVM and Layout Recommendations](#) section for suggested guidelines. For more details on the use and operation of fully differential op amps, refer to the Application Report [Fully-Differential Amplifiers \(SLOA054\)](#), available for download from the TI web site at [www.ti.com](#).

Differential Input to Differential Output Amplifier

The THS4524 is a fully-differential operational amplifier that can be used to amplify differential input signals to differential output signals. [Figure 61](#) shows a basic block diagram of the circuit (V_{OCM} and \overline{PD} inputs not shown). The gain of the circuit is set by R_F divided by R_G .

Figure 61. Differential Input to Differential Output Amplifier

Single-Ended Input to Differential Output Amplifier

The THS4524 can also amplify and convert single-ended input signals to differential output signals. [Figure 62](#) illustrates a basic block diagram of the circuit (V_{OCM} and \overline{PD} inputs not shown). The gain of the circuit is again set by R_F divided by R_G .

Figure 62. Single-Ended Input to Differential Output Amplifier

Input Common-Mode Voltage Range

The input common-mode voltage of a fully-differential op amp is the voltage at the + and – input pins of the device.

It is important to not violate the input common-mode voltage range (V_{ICR}) of the op amp. Assuming the op amp is in linear operation, the voltage across the input pins is only a few millivolts at most. Therefore, finding the voltage at one input pin determines the input common-mode voltage of the op amp.

Treating the negative input as a summing node, the voltage is given by [Equation 1](#):

$$\left(V_{OUT+} \times \frac{R_G}{R_G + R_F} \right) + \left(V_{IN-} \times \frac{R_F}{R_G + R_F} \right) \quad (1)$$

To determine the V_{ICR} of the op amp, the voltage at the negative input is evaluated at the extremes of V_{OUT+} . As the gain of the op amp increases, the input common-mode voltage becomes closer and closer to the input common-mode voltage of the source.

Setting the Output Common-Mode Voltage

The output common-mode voltage is set by the voltage at the V_{OCM} pin. The internal common-mode control circuit maintains the output common-mode voltage within 5-mV offset (typ) from the set voltage. If left unconnected, the common-mode set point is set to midsupply by internal circuitry, which may be overdriven from an external source.

THS4524-EP

SBOS609A – JUNE 2012 – REVISED AUGUST 2013

www.ti.com

Figure 63 represents the V_{OCM} input. The internal V_{OCM} circuit has typically 23 MHz of -3 dB bandwidth, which is required for best performance, but it is intended to be a dc bias input pin. A $0.22\text{-}\mu\text{F}$ bypass capacitor is recommended on this pin to reduce noise. The external current required to overdrive the internal resistor divider is given approximately by the formula in Equation 2:

$$I_{EXT} = \frac{2V_{OCM} - (V_{S+} - V_{S-})}{50\text{ k}\Omega}$$

where:

- V_{OCM} is the voltage applied to the V_{OCM} pin (2)

Figure 63. V_{OCM} Input Circuit

Typical Performance Variation with Supply Voltage

The THS4524 provides excellent performance across the specified power-supply range of 2.5 V to 5.5 V with only minor variations. The input and output voltage compliance ranges track with the power supply in nearly a 1:1 correlation. Other changes can be observed in slew rate, output current drive, open-loop gain, bandwidth, and distortion. Table 3 shows the typical variation to be expected in these key performance parameters.

Table 3. Typical Performance Variation versus Power-Supply Voltage

PARAMETER	$V_S = 5\text{ V}$	$V_S = 3.3\text{ V}$	$V_S = 2.5\text{ V}$
-3 -dB Small-signal bandwidth	145 MHz	135 MHz	125 MHz
Slew rate (2-V step)	490 V/ μ s	420 V/ μ s	210 V/ μ s
Harmonic distortion at 1 MHz, $2 V_{PP}$, $R_L = 1\text{ k}\Omega$			
Second harmonic	-85 dBc	-85 dBc	-84 dBc
Third harmonic	-91 dBc	-90 dBc	-88 dBc
Open-loop gain	119 dB	116 dB	115 dB
Linear output current drive	55 mA	35 mA	24 mA

Single-Supply Operation

To facilitate testing with common lab equipment, the THS4524EVM allows for split-supply operation; most of the characterization data presented in this data sheet is measured using split-supply power inputs. The device can easily be used with a single-supply power input without degrading performance.

Figure 64 shows a dc-coupled single-supply circuit with single-ended inputs. This circuit can also be applied to differential input sources.

Figure 64. THS4524 DC-Coupled Single-Supply with Single-Ended Inputs

The input common-mode voltage range of the THS4524 is designed to include the negative supply voltage. In the circuit shown in Figure 64, the signal source is referenced to ground. V_{OCM} is set by an external control source or, if left unconnected, the internal circuit defaults to midsupply. Together with the input impedance of the amplifier circuit, R_{IT} provides input termination, which is also referenced to ground.

Note that R_{IT} and optional matching components are added to the alternate input to balance the impedance at signal input.

Low-Power Applications and the Effects of Resistor Values on Bandwidth

For low-power operation, it may be necessary to increase the gain setting resistors values to limit current consumption and not load the source. Using larger value resistors lowers the bandwidth of the THS4524 as a result of the interactions between the resistors, the device parasitic capacitance, and printed circuit board (PCB) parasitic capacitance. Figure 65 shows the small-signal frequency response with 1-k Ω , 10-k Ω , and 100-k Ω resistors for R_F , R_G , and R_L (impedance is assumed to typically increase for all three resistors in low-power applications).

Figure 65. THS4524 Frequency Response with Various Gain Setting and Load Resistor Values

Frequency Response Variation due to Package Options

Users can see variations in the small-signal ($V_{OUT} = 100\text{ mV}_{PP}$) frequency response between the available package options for the THS452x family as a result of parasitic elements associated with each package and board layout changes. Figure 66 shows the variance measured in the lab; this variance is to be expected even when using a good layout.

Figure 66. Small-Signal Frequency Response: Package Variations

THS4524-EP

SBOS609A – JUNE 2012 – REVISED AUGUST 2013

www.ti.com

Driving Capacitive Loads

The THS4524 is designed for a nominal capacitive load of 1 pF on each output to ground. When driving capacitive loads greater than 1 pF, it is recommended to use small resistors (R_O) in series with the output, placed as close to the device as possible. Without R_O , capacitance on the output interacts with the output impedance of the amplifier and causes phase shift in the loop gain of the amplifier that reduces the phase margin. This reduction in phase margin results in frequency response peaking; overshoot, undershoot, and/or ringing when a step or square-wave signal is applied; and may lead to instability or oscillation. Inserting R_O isolates the phase shift from the loop gain path and restores the phase margin, but it also limits bandwidth. Figure 67 shows the recommended values of R_O versus capacitive loads (C_L), and Figure 68 shows an illustration of the frequency response with various values.

Figure 68. Frequency Response for Various R_O and C_L Values, with $R_{LOAD} = 1\text{ k}\Omega$

Figure 67. Recommended Series Output Resistor versus Capacitive Load for Flat Frequency Response, with $R_{LOAD} = 1\text{ k}\Omega$

Audio Performance

The THS4524 provides excellent audio performance with very low quiescent power. To show performance in the audio band, the device was tested with a SYS-2722 audio analyzer from Audio Precision. THD+N and FFT tests were performed at 1- V_{RMS} output voltage. Performance is the same on both 3.3-V and 5-V supplies. Figure 69 shows the test circuit used; see Figure 70 and Figure 71 for the performance of the analyzer using internal loopback mode (generator) together with the THS4524.

Figure 69. THS4524 AP Analyzer Test Circuit

Note that the harmonic distortion performance is very close to the same with and without the device meaning the THS4524 performance is actually much better than can be directly measured by this method. The actual device performance can be estimated by placing the device in a large noise gain and using the reduction in loop gain correction. The THS4524 is placed in a noise gain of 101 by adding a 10-Ω resistor directly across the input terminals of the circuit shown in Figure 69. This test was performed using the AP instrument as both the signal source and the analyzer. The second-order harmonic distortion at 1 kHz is estimated to be -122 dBc with $V_O = 1V_{RMS}$; third-order harmonic distortion is estimated to be -141 dBc. The third-order harmonic distortion result matches exactly with design simulations, but the second-order harmonic distortion is about 10 dB worse. This result is not unexpected because second-order harmonic distortion performance with a differential signal depends heavily on cancellation as a result of the differential nature of the signal, which depends on board layout, bypass capacitors, external cabling, and so forth. Note that the circuit of Figure 69 is also used to measure crosstalk between channels.

Figure 71. THS4524 1- V_{RMS} 10-kHz FFT Plot

The THS4524 shows even better THD+N performance when driving higher amplitude output, such as 5 V_{PP} that is more typical when driving an ADC. To show performance with an extended frequency range, higher gain, and higher amplitude, the device was tested with 5 V_{PP} up to 80 kHz with the AP. Figure 72 shows the resulting THD+N graph with no weighting.

Figure 70. THS4524 1- V_{RMS} 20-Hz to 20-kHz THD+N

Figure 72. THD+N (No Weighting) on AP, 80-kHz Bandwidth at $G = 1$ with 5- V_{PP} Output

Audio On/Off Pop Performance

The THS4524 was tested to show on and off pop performance by connecting a speaker between the differential outputs and switching the power supply on and off, and also by using the PD function of the THS4524. Testing was done with and without tones. During these tests, no audible pop could be heard.

With no tone input, Figure 73 shows the pop performance when switching power on to the THS4524 and Figure 74 shows the device performance when turning the power off. The transients during power on and off illustrate that no audible pop should be heard.

Figure 73. THS4524 Power-Supply Turn-On Pop Performance

Figure 74. THS4524 Power-Supply Turn-Off Pop Performance

With no tone input, Figure 75 shows the pop performance using the PD pin to enable the THS4524, and Figure 76 shows performance using the PD pin to disable the device. Again, the transients during power on and off show that no audible pop should be heard. It should also be noted that the turn on/off times are faster using the PD pin technique.

Figure 75. THS4524 PD Pin Enable Pop Performance

Figure 76. THS4524 PD Pin Disable Pop Performance

The power on/off pop performance of the THS4524, whether by switching the power supply or when using the power-down function built into the chip, shows that no special design should be required to prevent an audible pop.

Audio ADC Driver Performance: THS4524 and PCM4204 Combined Performance

To show achievable performance with a high-performance audio ADC, the THS4524 is tested as the drive amplifier for the PCM4204. The PCM4204 is a high-performance, four-channel ADC designed for professional and broadcast audio applications. The PCM4204 architecture uses a 1-bit delta-sigma ($\Delta\Sigma$) modulator per channel that incorporates an advanced dither scheme for improved dynamic performance, and supports PCM output data. The PCM4204 provides a flexible serial port interface and many other advanced features. Refer to the [PCM4204 product data sheet](#) for more information.

The PCM4204EVM can test the audio performance of the THS4524 as a drive amplifier. The standard PCM4204EVM is provided with four OPA1632 fully-differential amplifiers, which use the same device pinout as the THS4524. For testing, one of these amplifiers is replaced with a THS4524 device in same package (MSOP), and the power supply changes to a single-supply +5V. [Figure 79](#) shows the modifications made to the circuit. Note the resistor connecting the V_{OCM} input of the THS4524 to the input common-mode drive from the PCM4204 is shown removed and is optional; no performance change was noted with it connected or removed. The THS4524 is operated with a +5-V single-supply so the output common-mode defaults to +2.5 V as required at the input of the PCM4204. The EVM power connections were modified by connecting positive supply inputs,

+15 V, +5 VA and +5 VD, to a +5-V external power supply (EXT +3.3 was not used) and connecting -15 V and all ground inputs to ground on the external power supply. Note only one external +5-V supply was needed to power all devices on the EVM.

A SYS-2722 Audio Analyzer from Audio Precision (AP) provides an analog audio input to the EVM; the PCM-formatted digital output is read by the digital input on the AP.

Data were taken using a 256- f_s system clock to achieve $f_s = 48$ -kHz measurements, and audio output uses PCM format. Other data rates and formats are expected to show similar performance in line with that shown in the product data sheet.

[Figure 77](#) shows the THD+N vs Frequency response with no weighting; [Figure 78](#) shows an FFT of the output with 1-kHz input tone. Input signals to the PCM4204 for these tests is 0.5 dBFS. Dynamic range is also tested at -60 dBFS, $f_{IN} = 1$ kHz, and A-weighted. [Table 4](#) summarizes testing results using the THS4524 together with the PCM4204 versus typical data sheet performance measurements, and show that it make an excellent drive amplifier for this ADC.

The test circuit shown in [Figure 79](#) has a gain = 0.27 and attenuates the input signal. For applications that require higher gain, the circuit was modified to gains of $G = 1$, $G = 2$, and $G = 5$ by replacing the feedback resistors (R33 and R34) and re-tested to show performance.

Audio ADC Driver Performance: THS4524 and PCM3168 Combined Performance

The THS4524 is also tested as the drive amplifier for the PCM3168A ADC input. The PCM3168A is a high-performance, single-chip, 24-bit, 6-in/8-out, audio coder/decoder (codec) with single-ended and differential selectable analog inputs and differential outputs. The six-channel, 24-bit ADC employs a $\Delta\Sigma$ modulator and supports 8-kHz to 96-kHz sampling rates and a 16-bit/24-bit width digital audio output word on the audio interface. The eight-channel, 24-bit digital-to-analog converter (DAC) employs a $\Delta\Sigma$ modulator and supports 8-kHz to 192-kHz sampling rates and a 16-bit/24-bit width digital audio input word on the audio interface. Each audio interface supports I²S™, left/right-justified, and DSP formats with 16-bit/24-bit word width. In addition, the PCM3168A supports the time-division-multiplexed (TDM) format. The PCM3168A provides flexible serial port interface and many other advanced features. Refer to the PCM3168A product data sheet for more information.

The PCM3168A EVM is used to test the audio performance of the THS4524 as a drive amplifier. The standard PCM3168A EVM is provided with OPA2134 op amps that are used to convert single-ended inputs to differential to drive the ADC. For testing, the op amp output series resistors are removed from one of the channels and a THS4524, mounted on its standard EVM, is connected to the ADC inputs via short coaxial cables. The THS4524

EVM is configured for both differential inputs as shown in Figure 61 and for single-ended input as shown in Figure 62 with 1-k Ω resistors for R_F and R_G, and 24.9- Ω resistors in series with each output to isolate the outputs from the reactive load of the coaxial cables. To limit the noise from the external EVM and cables, a 2.7-nF capacitor is placed differentially across the PCM3168A inputs. The THS4524 is operated with a single-supply +5-V supply so the output common-mode of the THS4524 defaults to +2.5 V as required at the input of the PCM3168A. The PCM3168A EVM is configured and operated as described in the PCM3168A EVM User Guide. The ADC was tested with an external THS4524 EVM with both single-ended input and differential inputs. In both configurations, the results are the same. Figure 81 shows the THD+N versus frequency and Table 5 compares the result to the PCM3168 data sheet typical specification at 1 kHz. Both graphs show that it makes an excellent drive amplifier for this ADC. **Note:** a 2700 series Audio Analyzer from Audio Precision is used to generate the input signals to the THS4524 and to analyze the digital data from the PCM3168.

ADC Driver Performance: THS4524 and ADS1278 Combined Performance

The THS4524 provides excellent performance when driving high-performance $\Delta\Sigma$ and successive approximation register (SAR) ADCs in audio and industrial applications using a single 3-V to 5-V power supply. To show achievable performance, the THS4524 is tested as the drive amplifier for the ADS1278 24-bit ADC. The ADS1278 offers excellent ac and dc performance, with four selectable operating

modes from 10 kSPS to 128 kSPS to enable the user to fine-tune performance and power for specific application needs. The circuit shown in Figure 82 was used to test the performance. Data were taken using the High-Resolution mode (52 kSPS) of the ADS1278 with input frequencies at 1 kHz and 10 kHz and signal levels 1/2 dB below full-scale (–0.5 dBFS). FFT plots showing the spectral performance are given in Figure 83 and Figure 84; tabulated ac analysis results are shown in Table 6 and compared to the ADS1278 data sheet typical performance specifications.

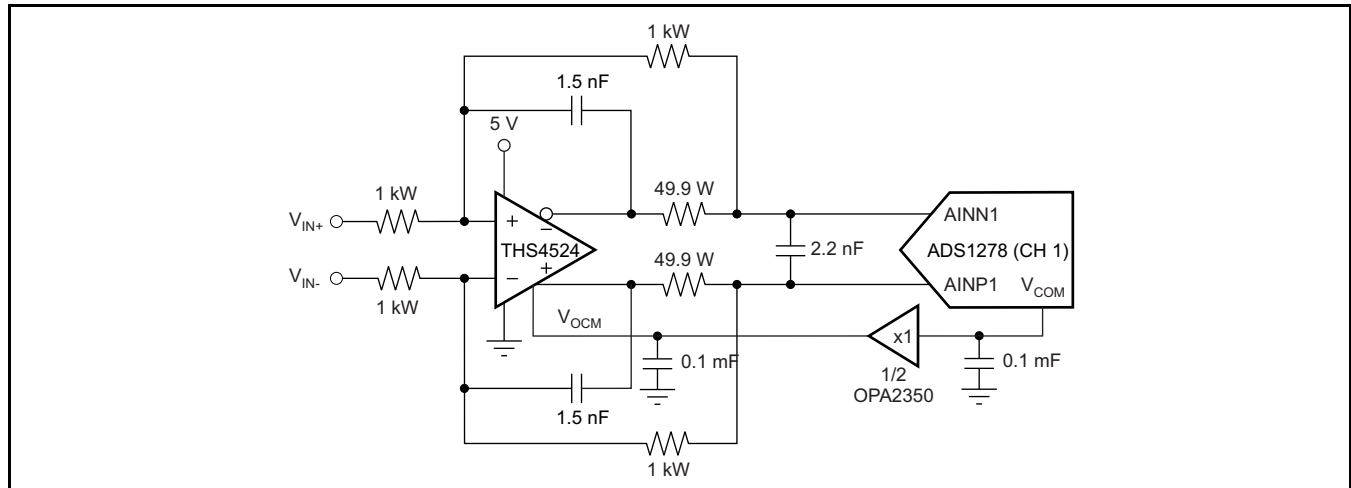

Figure 82. THS4524 and ADS1278 (Ch 1) Test Circuit

	10 kHz	–0.5	102	–110	101	110
ADS1278 Data sheet (typ)	1 kHz	–0.5	110	–108	—	109

**ADC Driver Performance:
THS4524 and ADS8321 Combined
Performance**

To demonstrate achievable performance, the THS4524 is tested as the drive amplifier for the ADS8321 16-bit SAR ADC. The ADS8321 offers excellent ac and dc performance, with ultra-low power and small size. The circuit shown in Figure 85 was used to test the performance.

Data were taken using the ADS8321 at 100 kSPS with input frequencies of 2 kHz and 10 kHz and signal levels that were -0.5 dBFS. FFT plots that illustrate the spectral performance are given in Figure 86 and Figure 87. Tabulated ac analysis results are listed in Table 7 and compared to the ADS8321 data sheet typical performance.

EVM AND LAYOUT RECOMMENDATIONS

Figure 88 shows the THS4524EVM schematic. PCB layers 1 through 4 are shown in Figure 89; Table 8 lists the bill of materials for the THS4524EVM as supplied from TI. It is recommended to follow the layout of the external components near to the amplifier, ground plane construction, and power routing as closely as possible. Follow these general guidelines:

1. Signal routing should be direct and as short as possible into and out of the op amp circuit.
2. The feedback path should be short and direct.
3. Ground or power planes should be removed from directly under the amplifier input and output pins.
4. An output resistor is recommended in each output lead, placed as near to the output pins as possible.
5. Two 0.1- μF power-supply decoupling capacitors should be placed as near to the power-supply pins as possible.
6. Two 10- μF power-supply decoupling capacitors should be placed within 1 inch of the device and can be shared among multiple analog devices.
7. A 0.22- μF capacitor should be placed between the V_{OCM} input pin and ground near to the pin. This capacitor limits noise coupled into the pin.
8. The $\overline{\text{PD}}$ pin uses TTL logic levels; a bypass capacitor is not necessary if actively driven, but can be used for robustness in noisy environments whether driven or not.
9. If input termination resistors R_{10} and R_{11} are used, a single point connection to ground on L2 is recommended.

Evaluation Board/Kit Important Notice

Texas Instruments (TI) provides the enclosed product(s) under the following conditions:

This evaluation board/kit is intended for use for **ENGINEERING DEVELOPMENT, DEMONSTRATION, OR EVALUATION PURPOSES ONLY** and is not considered by TI to be a finished end-product fit for general consumer use. Persons handling the product(s) must have electronics training and observe good engineering practice standards. As such, the goods being provided are not intended to be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including product safety and environmental measures typically found in end products that incorporate such semiconductor components or circuit boards. This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and therefore may not meet the technical requirements of these directives or other related directives.

Should this evaluation board/kit not meet the specifications indicated in the User's Guide, the board/kit may be returned within 30 days from the date of delivery for a full refund. **THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE.**

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user indemnifies TI from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge.

EXCEPT TO THE EXTENT OF THE INDEMNITY SET FORTH ABOVE, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

TI currently deals with a variety of customers for products, and therefore our arrangement with the user **is not exclusive**.

TI assumes **no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein.**

Please read the User's Guide and, specifically, the Warnings and Restrictions notice in the User's Guide prior to handling the product. This notice contains important safety information about temperatures and voltages. For additional information on TI's environmental and/or safety programs, please contact the TI application engineer or visit www.ti.com/esh.

No license is granted under any patent right or other intellectual property right of TI covering or relating to any machine, process, or combination in which such TI products or services might be or are used.

FCC Warning

This evaluation board/kit is intended for use for **ENGINEERING DEVELOPMENT, DEMONSTRATION, OR EVALUATION PURPOSES ONLY** and is not considered by TI to be a finished end-product fit for general consumer use. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

EVM Warnings and Restrictions

It is important to operate this EVM within the input voltage range of 3 V to 5.5 V and the output voltage range of 3 V to 5.5 V.

Exceeding the specified input range may cause unexpected operation and/or irreversible damage to the EVM. If there are questions concerning the input range, please contact a TI field representative prior to connecting the input power.

Applying loads outside of the specified output range may result in unintended operation and/or possible permanent damage to the EVM. Please consult the EVM User's Guide prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative.

During normal operation, some circuit components may have case temperatures greater than 125°C. The EVM is designed to operate properly with certain components above 125°C as long as the input and output ranges are maintained. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors. These types of devices can be identified using the EVM schematic located in the EVM User's Guide. When placing measurement probes near these devices during operation, please be aware that these devices may be very warm to the touch.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals.  - This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusion.
 - Falls within JEDEC MO-153.

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
