### DESCRIPTION

The bq20z90-V110 SBS-compliant gas gauge IC, incorporating patented Impedance Track™ technology, is designed for battery-pack or in-system installation. The bq20z90-V110 measures and maintains an accurate record of available charge in Li-ion or Li-polymer batteries using its integrated high-performance analog peripherals. The bq20z90-V110 monitors capacity change, battery impedance, open-circuit voltage, and other critical parameters of the battery pack, and reports the information to the system host controller over a serial-communication bus. It is designed to work with the bq29330 analog front-end (AFE) protection IC to maximize functionality and safety, and minimize component count and cost in smart battery circuits.

The Impedance Track technology continuously analyzes the battery impedance, resulting in superior gas-gauging accuracy. This enables remaining capacity to be calculated with discharge rate, temperature, and cell aging all accounted for during each stage of every cycle.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

- Report charging faults and also indicate charging status via charge and discharge alarms.

### Gas Gauging

### Power Modes

The bq20z90-V110 supports 3 different power modes to reduce power consumption:

- In Normal Mode, the bq20z90-V110 performs measurements, calculations, protection decisions, and data updates in 1 second intervals. Between these intervals, the bq20z90-V110 is in a reduced power stage.
- In Sleep Mode, the bq20z90-V110 performs measurements, calculations, protection decisions, and data updates in adjustable time intervals. Between these intervals, the bq20z90-V110 is in a reduced power stage.
- In Shutdown Mode the bq20z90-V110 is completely disabled.

## CONFIGURATION

### Oscillator Function

The bq20z90-V110 fully integrates the system and processor oscillators and, therefore, requires no pins or components for this feature.

### System Present Operation

The bq20z90-V110 periodically verifies the  $\overline{\text{PRES}}$  pin and detects that the battery is present in the system via a low state on a  $\overline{\text{PRES}}$  input. When this occurs, bq20z90-V110 enters normal operating mode. When the pack is removed from the system and the  $\overline{\text{PRES}}$  input is high, the bq20z90-V110 enters the battery-removed state, disabling the charge, discharge and ZVCHG FETs. The  $\overline{\text{PRES}}$  input is ignored and can be left floating when non-removal mode is set in the data flash.

## FEATURE SET (continued)

### BATTERY PARAMETER MEASUREMENTS

The bq20z90-V110 uses an integrating delta-sigma analog-to-digital converter (ADC) for current measurement, and a second delta-sigma ADC for individual cell and battery voltage, and temperature measurement.

#### Charge and Discharge Counting

The integrating delta-sigma ADC measures the charge/discharge flow of the battery by measuring the voltage drop across a small-value sense resistor between the SRP and SRN pins. The integrating ADC measures bipolar signals from -0.25 V to 0.25 V. The bq20z90-V110 detects charge activity when  $V_{SR} = V_{(SRP)} - V_{(SRN)}$  is positive and discharge activity when  $V_{SR} = V_{(SRP)} - V_{(SRN)}$  is negative. The bq20z90-V110 continuously integrates the signal over time, using an internal counter. The fundamental rate of the counter is 0.65 nVh.

#### Voltage

The bq20z90-V110 updates the individual series cell voltages through the bq29330 at one second intervals. The bq20z90-V110 configures the bq29330 to connect the selected cell, cell offset, or bq29330 VREF to the CELL pin of the bq29330, which is required to be connected to VIN of the bq20z90. The internal ADC of the bq20z90-V110 measures the voltage, scales it, and calibrates itself appropriately. This data is also used to calculate the impedance of the cell for the Impedance Track™ gas-gauging.

#### Current

The bq20z90-V110 uses the SRP and SRN inputs to measure and calculate the battery charge and discharge current using a 5 mΩ to 20 mΩ typ. sense resistor.

#### Wake Function

The bq20z90-V110 can exit sleep mode, if enabled, by the presence of a programmable level of current signal across SRP and SRN.

#### Auto Calibration

The bq20z90-V110 provides an auto-calibration feature to cancel the voltage offset error across SRP and SRN for maximum charge measurement accuracy. The bq20z90-V110 performs auto-calibration when the SMBus lines stay low continuously for a minimum of a programmable amount of time.

#### Temperature

The bq20z90-V110 TS1 and TS2 inputs, in conjunction with two identical NTC thermistors (default are Semitec 103AT), measure the battery environmental temperature. The bq20z90-V110 can also be configured to use its internal temperature sensor.

### COMMUNICATIONS

The bq20z90-V110 uses SMBus v1.1 with Master Mode and package error checking (PEC) options per the SBS specification.

#### SMBus On and Off State

The bq20z90-V110 detects an SMBus off state when SMBC and SMBD are logic-low for  $\geq 2$  seconds. Clearing this state requires either SMBC or SMBD to transition high. Within 1 ms, the communication bus is available.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
