Lead-free Green

## Description

AP1520 consists of step-down switching regulator with PWM control These devices include a reference voltage source, oscillation circuit error amplifier and internal PMOS.

AP1520 provides low-ripple power, high efficiency and excellen transient characteristics. The PWM control circuit is able to vary the duty ratio linearly from 0 up to $100 \%$. This converter also contains ar error amplifier circuit. An enable function, an over current protectior and a short circuit protection are built inside, and when OCP or SCF happens, the operation frequency will be reduced from 300 kHz tc 30 kHz . Also, an internal compensation block is built in to minimum external component count.

With the addition of an internal P-channel Power MOS, a coil, capacitors, and a diode connected externally, these ICs can function as step-down switching regulators. They serve as ideal power supply units for portable devices when coupled with the SO-8 package providing such outstanding features as low current consumption. Since this converter can accommodate an input voltage up to 23 V , it is also suitable for the operation via an AC adapter.

## Features

- Input Voltage: 3.6V to 23 V
- Output Voltage: 0.8 V to $\mathrm{V}_{\mathrm{cc}}$
- Duty Ratio: 0\% to $100 \%$ PWM Control
- Oscillation Frequency: 300 kHz Typ
- Current Limit, Enable Function
- Thermal Shutdown Function
- Built-in Internal SW P-channel MOS
- Totally Lead-Free \& Fully RoHS Compliant (Notes 1 \& 2)
- Halogen and Antimony Free."Green" Device (Note 3)

## Pin Assignments

## Applications

- PC Motherboard
- LCD Monitor
- Graphic Card
- DVD-Video Player
- Telecom Equipment
- ADSL Modem
- Printer and Other Peripheral Equipment
- Microprocessor Core Supply
- Networking Power Supply

Notes: 1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS) \& 2011/65/EU (RoHS 2) compliant.
2. See http://www.diodes.com/quality/lead_free.html for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free,"Green" and Lead-free
3. Halogen- and Antimony-free "Green" products are defined as those which contain $<900 \mathrm{ppm}$ bromine, $<900 \mathrm{ppm}$ chlorine ( $<1500 \mathrm{ppm}$ total $\mathrm{Br}+\mathrm{Cl}$ ) and <1000ppm antimony compounds.

## Typical Applications Circuit

$$
\text { Note: } V_{\text {Out }}=V_{F B} \times\left(1+R_{A} / R_{B}\right)
$$ $R_{B}=0.7 \mathrm{k} \Omega$ to $5 \mathrm{k} \Omega$

AP1520

## Pin Descriptions

| Pin Number | Pin Name | Description |
| :---: | :---: | :--- |
| 1 | FB | Feedback pin |
| 2 | EN | Enable Input pin <br> H: Normal operation <br> (Step-down operation) <br> L: Step-down operation stopped <br> (All circuits deactivated) |
| 3 | OCSET | Add an external resistor to set max output current |
| 4 | VCC $^{\text {Output }}$ | IC power supply pin |
| 5,6 | Switch Pin. Connect external inductor/diode here. Minimize trace area at this pin to reduce EMI |  |
| 7,8 | GND Pin |  |

## Functional Block Diagram

## Functional Description

## PWM Control

The AP1520 is a DC/DC converter that employs pulse width modulation (PWM) scheme. Its pulse width varies in the range of 0\% to $99 \%$, based on the output current loading. The output ripple voltage caused by the PWM high frequency switching can easily be reduced through an output filter. Therefore, this converter provides a low ripple output supply over a broad range of input voltage \& output current loading.

## Under Voltage Lockout

The under voltage lockout circuit of the AP1520 assures that the high-side MOSFET driver remains in the off state whenever the supply voltage drops below 3.3V. Normal operation resumes once $\mathrm{V}_{\mathrm{CC}}$ rises above 3.5 V .

## Current Limit Protection

The current limit threshold is set by external resistor R RCSET connected from $\mathrm{V}_{\mathrm{CC}}$ supply to OCSET pin. The internal sink current locset ( $90 \mu \mathrm{~A}$ typical) across this resistor sets the voltage at OCSET pin. When the PWM voltage is less than the voltage at OCSET, an over-current condition is triggered.

The current limit threshold is given by the following equation:
$I_{\text {PEAK }}{ }^{\times} R_{\text {DSS(ON) }}={ }^{\text {IOCSET }}{ }^{\times}$R OCSET
$\mathrm{I}_{\text {PEAK }}>\mathrm{I}_{\mathrm{OUT}(\mathrm{MAX})}+\frac{(\Delta \mathrm{I})}{2}$
where,
$\Delta I=\frac{V_{\text {IN }}-V_{\text {OUT }}}{f s \times L} \times \frac{V_{\text {OUT }}}{V_{\text {IN }}}$

IPEAK is the output peak current; $R_{D S(O N)}$ is the MOSFET ON resistance; $\mathrm{f}_{\mathrm{S}}$ is the PWM frequency ( 300 kHz typical). Also, the inductor value will affect the ripple current $\Delta \mathrm{l}$.

The above equation is recommended for input voltage range of 5 V to 18 V . For input voltage lower than 5 V or ambient temperature over $+100^{\circ} \mathrm{C}$, higher Rocset is recommended.

## Inductor Selection

For most designs, the operation range with inductors is from $22 \mu \mathrm{H}$ to $33 \mu \mathrm{H}$. The inductor value can be derived from the following equation:
$L=\frac{V_{\text {IN }}-V_{\text {OUT }}}{f s \times \Delta I} \times \frac{V_{\text {OUT }}}{V_{\text {IN }}}$

Where $\Delta \mathrm{L}$ is inductor Ripple Current. Large value inductors lower ripple current and small value inductors result in high ripple current. Choose inductor ripple current approximately $15 \%$ of the maximum load current $2 \mathrm{~A}, \Delta \mathrm{~L}=0.30 \mathrm{~A}$. The DC current rating of the inductor should be at least equal to the maximum load current plus half the ripple current to prevent core saturation ( $2 \mathrm{~A}+0.15 \mathrm{~A}$ ).

## Input Capacitor Selection

This capacitor should be located close to the IC using short leads and the voltage rating should be approximately 1.5 times the maximum input voltage. The RMS current rating requirement for the input capacitor of a buck regulator is approximately 12 the DC load current. A low ESR input capacitor sized for maximum RMS current must be used. A $470 \mu \mathrm{~F}$ low ESR capacitor for most applications is sufficient.

## Output Capacitor Selection

The output capacitor is required to filter the output voltage and provides regulator loop stability. The important capacitor parameters are the 100 kHz Equivalent Series Resistance (ESR), the RMS ripples current rating, voltage rating and capacitance value. For the output capacitor, the ESR value is the most important parameter. The output ripple can be calculated from the following formula.

AP1520

## Functional Description (Cont.)

$\mathrm{V}_{\text {RIPPLE }}=\Delta \mathrm{I}_{\mathrm{L}} \times E S R$

The bulk capacitor's ESR will determine the output ripple voltage and the initial voltage drop after a high slew-rate transient.

An aluminum electrolytic capacitor's ESR value is related to the capacitance and its voltage rating. In most case, higher voltage electrolytic capacitors have lower ESR values. Most of the time, capacitors with much higher voltage ratings may be needed to provide the low ESR values required for low output ripple voltage.

## PCB Layout Guide

If you need low $T_{C} \& T_{J}$ or large $P_{D}$ (Power Dissipation), the dual Output pins (5 \& 6) and $V_{s s}$ pins ( $7 \& 8$ ) on the SO-8 package are internally connected to die pad, the evaluation board should be allowed for maximum copper area at output pins.

1. Connect FB circuits as closely as possible and keep away from inductor flux for pure $\mathrm{V}_{\mathrm{FB}}$.
2. Connect input capacitor to $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\mathrm{SS}}$ pin as closely as possible to get good power filter effect.
3. Connect Rocset to $\mathrm{V}_{\mathrm{CC}}$ and OCSET pin as closely as possible.
4. Connect ground side of the input capacitor \& Schottky \& output capacitor as closely as possible and use ground plane for best performance.

## LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:
A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.
B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
