

PXD30-xxWDxx Dual Output DC/DC Converters

9 to 36 Vdc and 18 to 75 Vdc input, ± 5 to ± 15 Vdc Dual Output, 30W

Applications

- Wireless Network
- Telecom/Datacom
- Industry Control System
- Measurement
- Semiconductor Equipment

Features

- RoHS compliant
- Dual output up to ± 3000 mA
- Six-sided continuous shield
- No minimum load required
- High power density
- High efficiency up to 88%
- Small size
2.00 x 1.00 x 0.400 inch (50.8 x 25.4 x 10.2 mm)
- Input to output isolation (1600VDC)
- 4:1 ultra wide input voltage range
- Fixed switching frequency
- Input under-voltage protection
- Output over-voltage protection
- Over-current protection
- Output short circuit protection
- Remote on/off
- Case grounding

Options

- Negative logic Remote On/Off
- Heatsink

General Description

The PXD30-xxWDxx dual output series offers 30 watts of output power from a 2 x 1.0 x 0.4 inch package. This converter has a 4:1 ultra wide input voltage of 9-36VDC, 18-75VDC and features 1600VDC of isolation, short circuit protection, over-voltage protection, over-current protection and six sided shielding. All models are particularly suited for telecommunications, industrial, mobile telecom and test equipment applications.

Testing Configurations

Input reflected-ripple current measurement test:

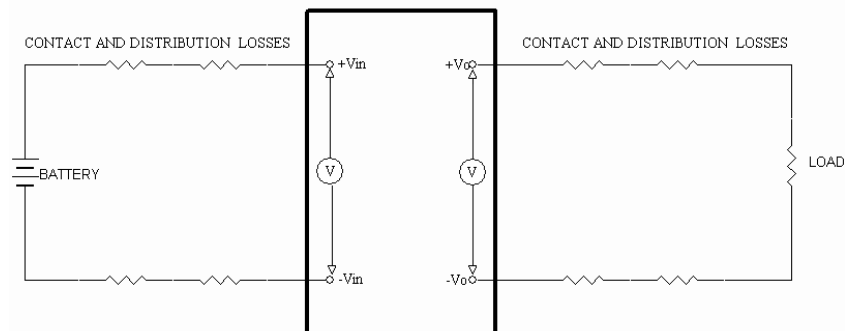

Component	Value	Voltage	Reference
L	12μH	---	---
C	47μF	100V	Aluminum Electrolytic Capacitor

Peak-to-peak output ripple & noise measurement test:

Output voltage and efficiency measurement test:

Note: All measurements are taken at the module terminals.

$$Efficiency = \left(\frac{V_o \times I_o}{V_{in} \times I_{in}} \right) \times 100\%$$

EMC Considerations

Suggested Schematic for EN55022 Conducted Emission Class A Limits

Recommended Layout With Input Filter

To meet conducted emissions EN55022 CLASS A the following components are needed:

PXD30-24WDxx

Component	Value	Voltage	Reference
C1	4.7uF	50V	1812 MLCC
C2、C3、C4	1000pF	2KV	1808 MLCC

PXD30-48WDxx

Component	Value	Voltage	Reference
C1	2.2uF	100V	1812 MLCC
C2、C3、C4	1000pF	2KV	1808 MLCC

Input Source Impedance

The converter should be connected to a low impedance input source. Highly inductive source impedance can affect the stability of the converter. Input external L-C filter is recommended to minimize input reflected ripple current. The inductor has a simulated source impedance of 12 μ H and capacitor is Nippon chemi-con KY series 47 μ F/100V. The capacitor must be located as close as possible to the input terminals of the converter for lower impedance.

Output Over Current Protection

When excessive output currents occur in the system, circuit protection is required on all converters. Normally, overload current is maintained at approximately 150 percent of rated current for PxD30-xxWDxx series.

Hiccup-mode is a method of operation in the converter whose purpose is to protect the converter from being damaged during an over-current fault condition. It also enables the converter to restart when the fault is removed.

One of the problems resulting from over current is that excessive heat may be generated in power devices; especially MOSFET and Schottky diodes and the temperature of those devices may exceed their specified limits. A protection mechanism has to be used to prevent those power devices from being damaged.

Output Over Voltage Protection

The output over-voltage protection consists of an output Zener diode that monitors the voltage on the output terminals. If the voltage on the output terminals exceeds the over-voltage protection threshold, then the Zener diode clamps the output voltage.

Short Circuit Protection

Continuous, hiccup and auto-recovery.

Thermal Consideration

The converter operates in a variety of thermal environments. Sufficient cooling should be provided to help ensure reliable operation of the unit. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the point as shown in the figure below. The temperature at this location should not exceed 105°C. When operating, adequate cooling must be provided to maintain the test point temperature at or below 105°C. Although the maximum point temperature of the converter is 105°C, limiting this temperature to a lower value will increase the reliability of this device.

Measurement shown in inches and (millimeters)

TOP VIEW

Heat Sink Consideration

Use heat-sink (7G-0020C) for lowering temperature; thus increasing the reliability of the converter.

Heatsink + Clamp

Heatsink

Measurement shown in inches and (millimeters)

Remote ON/OFF Control

Positive Logic – (no suffix) , the positive logic remote ON/OFF control circuit is included. Ex.: PXD30-24WD05
 Turns the converter ON during logic High on the On/Off pin and turns the converter OFF during logic Low.
 The On/Off pin is an open collector/drain logic input signal (Von/off) that is referenced to GND.
 If not using the remote on/off feature, an open circuit between on/off pin and (-) input pin is needed to turn the module on.

Negative Logic – (suffix -N), the negative logic remote ON/OFF control circuit is included. Ex.: PXD30-24WD05-N
 Turns the converter ON during logic Low on the On/Off pin and turns the converter OFF during logic High.
 The On/Off pin is an open collector/drain logic input signal (Von/off) that is referenced to GND.
 If not using the remote on/off feature, a short circuit between on/off pin and (-) input pin is needed to turn the module on.

Safety and Installation Instructions

Fusing Consideration

Caution: This converter is not internally fused. An input line fuse must always be used.

This encapsulated converter can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. For maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a slow-blow fuse with a maximum rating of 10A. Based on the information provided in this data sheet on inrush energy and maximum dc input current; the same type of fuse with lower rating can be used. Refer to the fuse manufacturer's data for further information.

MTBF and Reliability

The MTBF of PXD30-xxWDxx series of DC/DC converters has been calculated using:

Bellcore TR-NWT-000332 Case I: 50% stress, Operating Temperature at 40°C °C (Ground fixed and controlled environment). The resulting figure for MTBF is 3.163×10^6 hours.

MIL-HDBK 217F NOTICE2 FULL LOAD, Operating Temperature at 25°C □. The resulting figure for MTBF is 4.347×10^5 hours.
