

## LMP8278Q High Common Mode, 14 x Gain, Precision Current Sensing Amplifier

Check for Samples: [LMP8278](#)

### FEATURES

- TCVo<sub>s</sub> ±15µV/°C Max
- CMRR 80 dB Min
- Input Offset Voltage ±2 mV max
- CMVR -2V to 40V
- Operating Ambient Temperature Range -40°C to 125°C
- Single Supply Operation
- Min / Max Limits 100% Tested unless Otherwise Noted
- LMP8278Q Available in Automotive AEC-Q100 Grade 1 Qualified Version

### APPLICATIONS

- High Side and Low Side Driver Configuration Current Sensing
- Automotive Fuel Injection Control
- Transmission Control
- Power Steering
- Battery Management Systems

### DESCRIPTION

The LMP8278 is a fixed 14x gain precision current sense amplifier. The part amplifies and filters small differential signals in the presence of high common mode voltages. The part operates from a single 5V supply voltage. With an input common mode voltage range from -2V to +28V the gain is very precise (±0.5%). The part can handle common mode voltages in the range -2V to +40V with relaxed specifications. The LMP8278 is a member of the Linear Monolithic Precision (LMP™) family and is ideal for unidirectional current sensing applications. The parameter values that are shown in the Electrical Characteristics table are 100% tested and all bold values are also 100% tested over temperature, unless otherwise noted.

The part has a precise gain of 14x which is adequate in most targeted applications to drive an ADC to its full scale value. The fixed gain is achieved in two separate stages, a preamplifier with a gain of 7x and an output stage buffer amplifier with a gain of 2x. The connection between the two stages of the signal path is brought out on two pins to enable the possibility to create an additional filter network around the output buffer amplifier. These pins can also be used for alternative configurations with different gain as described in [Application Information](#).

The LMP8278Q incorporates enhanced manufacturing and support processes for the automotive market, including defect detection methodologies. Reliability qualification is compliant with the requirements and temperature grades defined in the AEC Q100 standard.

### Typical Applications

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

See Package Number DGK0008A**

**PIN DESCRIPTIONS**

	Pin	Name	Description
Power Supply	2	GND	Power Ground
	7	V <sub>S</sub>	Positive Supply Voltage
Inputs	1	-IN	Negative Input
	8	+IN	Positive Input
Filter Network	3	A1	Preamplifier output
	4	A2	Input from the external filter network and / or A1
Output	5	OUT	Single ended output
NC	6	N/C	No Connect (floating)

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## Absolute Maximum Ratings <sup>(1)</sup>

ESD Tolerance <sup>(2)</sup>	
Human Body	
For input pins only	±8000V
For all other pins	±2000V
Machine Model	200V
Charge Device Model	1000V
Supply Voltage ( $V_S$ - GND)	6V
Continuous Input Voltage (-IN and +IN) <sup>(3)</sup>	-12V to 50V
Max Voltage at A1, A2 and OUT	$V_S + 0.3V$
Min Voltage at A1, A2 and OUT	GND -0.3V
Storage Temperature Range	-65°C to 150°C
Junction Temperature <sup>(4)</sup>	150°C
For soldering specs see: <a href="#">SNOA549C</a>	

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of the device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified.
- (2) Human Body Model per MIL-STD-883, Method 3015.7. Machine Model, per JESD22-A115-A. Field-Induced Charge-Device Model, per JESD22-C101-C.
- (3) For the VSSOP package, the pitch of the solder pads is too narrow for reliable use at higher voltages ( $V_{CM} > 25V$ ). Therefore, it is strongly advised to add a conformal coating on the PCB assembled with the LMP8278 / LMP8278Q.
- (4) The maximum power dissipation must be derated at elevated temperatures and is dictated by  $T_{J(MAX)}$ ,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation  $P_{DMAX} = (T_{J(MAX)} - T_A) / \theta_{JA}$  or the number given in Absolute Maximum Ratings, whichever is lower.

## Operating Ratings <sup>(1)</sup>

Supply Voltage ( $V_S$ - GND)	4.5V to 5.5V
Temperature Range <sup>(2)</sup>	-40°C to +125°C
Package Thermal Resistance <sup>(2)</sup>	
8-Pin VSSOP ( $\theta_{JA}$ )	230°C/W

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of the device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified.
- (2) The maximum power dissipation must be derated at elevated temperatures and is dictated by  $T_{J(MAX)}$ ,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation  $P_{DMAX} = (T_{J(MAX)} - T_A) / \theta_{JA}$  or the number given in Absolute Maximum Ratings, whichever is lower.

## 5.0V Electrical Characteristics <sup>(1)</sup>

Unless otherwise specified, all limits ensured at  $T_A = 25^\circ\text{C}$ ,  $V_S = 5.0\text{V}$ ,  $\text{GND} = 0\text{V}$ ,  $-2\text{V} \leq V_{\text{CM}} \leq 28\text{V}$ , and  $R_L = \infty$ ,  $10\text{nF}$  between  $V_S$  and  $\text{GND}$ . **Boldface** limits apply at the temperature extremes.

PARAMETER		TEST CONDITIONS		MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT

## APPLICATION INFORMATION

### GENERAL

The LMP8278 is a fixed gain differential voltage precision amplifier with a gain of 14x and a -2V to +40V input common mode voltage range when operating from a single 5V supply. The LMP8278 is a member of the LMP™ family and is ideal for unidirectional current sensing applications. Because of its proprietary level-shift input stage the LMP8278 achieves very low offset, very low thermal offset drift, and very high CMRR. The LMP8278 amplifies and filters small differential signals in the presence of high common mode voltages.

The LMP8278 uses level shift resistors at the inputs. Because of these resistors, the LMP8278 can easily withstand very large differential input voltages that may exist in fault conditions where some other less protected current sense amplifiers might sustain permanent damage.

The LMP8278 is available in an 8-Pin VSSOP package. For the VSSOP package, the pitch of the solder pads is too narrow for reliable use at higher voltages ( $V_{CM} > 25V$ ). Therefore, it is strongly advised to add a conformal coating on the PCB assembled with the LMP8278 in VSSOP package.

### PERFORMANCE GUARANTIES

To guaranty the high performance of the LMP8278, minimum and maximum values shown in the [Electrical Characteristics](#) of this datasheet are 100% tested and all bold limits are also 100% tested over temperature, unless otherwise noted.

### THEORY OF OPERATION

The schematic shown in [Figure 20](#) gives a schematic representation of the internal operation of the LMP8278.

The signal on the input pins is typically a small differential voltage across a current sensing shunt resistor. The input signal may appear at a high common mode voltage. The input signals are accessed through two input resistors. The proprietary level shift circuit brings the common mode voltage behind the input resistors within the supply rails. Subsequently, the signal is gained up by a factor of 7 and brought out on the A1 pin through a trimmed 100 kΩ resistor. In the application, additional gain adjustment or filtering components can be added between the A1 and A2 pins as will be explained in subsequent sections. The signal on the A2 pin is further amplified by a factor of 2 and brought out on the OUT pin.

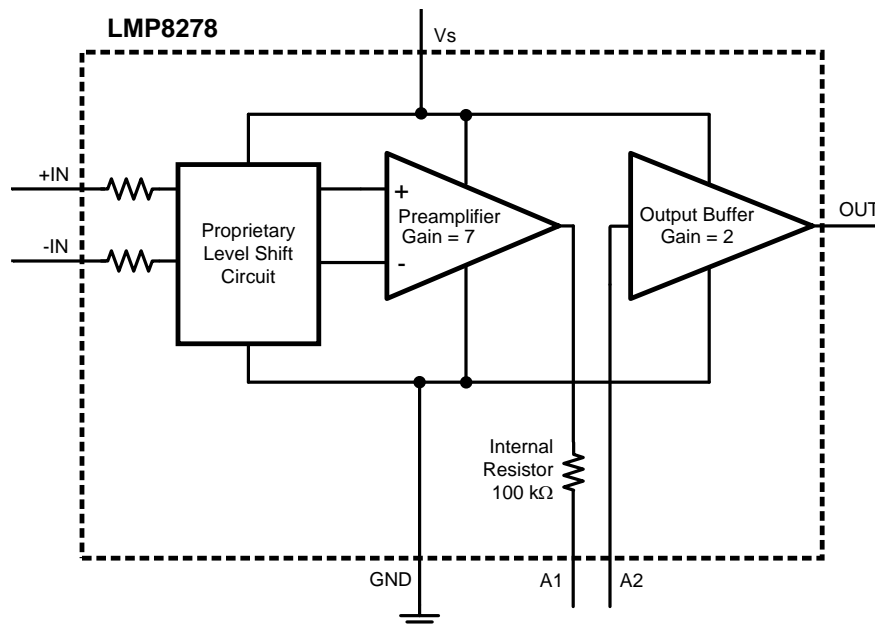

Figure 20. Theory of Operation

## ADDITIONAL SECOND ORDER LOW PASS FILTER

The bandwidth of the output buffer can be reduced by adding a capacitor on the A1 pin to create a first order low pass filter with a time constant determined by the 100 kΩ internal resistor and the external filter capacitor.

It is also possible to create an additional second order Sallen-Key low pass filter, as illustrated in [Figure 21](#), by adding external components  $R_2$ ,  $C_1$  and  $C_2$ . Together with the internal 100 kΩ resistor  $R_1$ , this circuit creates a second order low-pass filter characteristic.

When the corner frequency of the additional filter is much lower than 90 kHz, the transfer function of the described amplifier can be written as:

$$H(s) = \frac{K_1 * K_2 \frac{1}{R_1 R_2 C_1 C_2}}{s^2 + s * \left[ \frac{1}{R_1 C_2} + \frac{1}{R_2 C_2} + \frac{(1 - K_2)}{R_2 C_1} \right] + \frac{1}{R_1 R_2 C_1 C_2}}$$

where

- $K_1$  equals the gain of the preamplifier
  - $K_2$  that of the buffer amplifier
- (1)

The above equation can be written in the normalized frequency response for a 2<sup>nd</sup> order low pass filter:

$$G(j\omega) = K_1 * \frac{K_2}{\frac{(j\omega)^2}{\omega_o^2} + \frac{j\omega}{Q\omega_o} + 1}$$
(2)

The cutt-off frequency  $\omega_o$  in rad/sec (divide by  $2\pi$  to get the cut-off frequency in Hz) is given by:

$$\omega_o = \frac{1}{\sqrt{R_1 R_2 C_1 C_2}}$$
(3)

And the quality factor of the filter is given by:

$$Q = \frac{\sqrt{R_1 R_2 C_1 C_2}}{R_1 C_1 + R_2 C_1 + (1 - K_2) * R_1 C_2}$$
(4)

With  $K_2 > 1x$ , the above equation results in:

$$Q = \frac{\sqrt{R_1 R_2 \frac{C_1^2}{(K-1)}}}{R_1 C_1 + R_2 C_1 - \frac{(K-1) R_1 C_2}{(K-1)}}$$
(5)

For any filter gain  $K > 1x$ , the design procedure can be very simple if the two capacitors are chosen in a certain ratio.

$$C_2 = \frac{C_1}{K - 1}$$
(6)

In this case, given the predetermined value of  $R_1 = 100 \text{ k}\Omega$  (the internal resistor), the quality factor is set solely by the value of the resistor  $R_2$ .

$R_2$  can be calculated based on the desired value of  $Q$  as the first step of the design procedure with the following equation:

$$R_2 = \frac{R_1}{(K-1)Q^2} \quad (7)$$

For the gain of 2 for the LMP8278 this results in:

$$R_2 = \frac{R_1}{Q^2} \quad (8)$$

Figure 21. Second Order Low Pass Filter

For instance, the value of  $Q$  can be set to  $0.5\sqrt{2}$  to create a Butterworth response, to  $1/\sqrt{3}$  to create a Bessel response, or to 0.5 to create a critically damped response. Once the value of  $R_2$  has been found, the second and last step of the design procedure is to calculate the required value of  $C$  to give the desired low-pass cut-off frequency using:

$$C_1 = \frac{(K-1)Q}{R_1\omega_0} \quad (9)$$

Which for the gain=2 will give:

$$C_1 = \frac{Q}{R_1\omega_0} \quad (10)$$

For  $C_2$  the value is calculated with:

$$C_2 = \frac{C_1}{K-1} \quad (11)$$

Or, for a gain=2,  $C_2=C_1$

Note that the frequency response achieved using this procedure will only be accurate if the cut-off frequency of the second order filter is much smaller than the intrinsic 90 kHz low-pass response. In other words, choose the frequency response of the circuit such that the internal poles of the LMP8278 do not affect the external second order filter.

For a desired  $Q = 0.707$  and a cut off frequency = 3 kHz, this will result in rounded values for  $R_2 = 200 \text{ k}\Omega$ ,  $C_1:C_2 = 390 \text{ pF}$ .

## GAIN ADJUSTMENT

The gain of the LMP8278 is 14; however, this gain can be adjusted as the signal path in between the two internal amplifiers is available on the external pins.

### Reduce Gain

Figure 22 shows the configuration that can be used to reduce the gain of the LMP8278.

$R_r$  creates a resistive divider together with the internal  $100 \text{ k}\Omega$  resistor such that the reduced gain  $G_r$  becomes:

$$G_r = \frac{14 R_r}{R_r + 100 \text{ k}\Omega} \quad (12)$$

Given a desired value of the reduced gain  $G_r$ , using this equation the required value for  $R_r$  can be calculated with:

$$R_r = 100 \text{ k}\Omega \times \frac{G_r}{14 - G_r} \quad (13)$$

### Increase Gain

Figure 23 shows the configuration that can be used to increase the gain of the LMP8278.

$R_i$  creates positive feedback from the output pin to the input of the buffer amplifier. The positive feedback increases the gain. The increased gain  $G_i$  becomes:

$$G_i = \frac{14 R_i}{R_i - 100 \text{ k}\Omega} \quad (14)$$

From this equation, for a desired value of the gain, the required value of  $R_i$  can be calculated with:

$$R_i = 100 \text{ k}\Omega \times \frac{G_i}{G_i - 14} \quad (15)$$

It should be noted from the equation for the gain  $G_i$  that for large gains  $R_i$  approaches  $100 \text{ k}\Omega$ . In this case, the denominator in the equation becomes close to zero. In practice, for large gains the denominator will be determined by tolerances in the values of the external resistor  $R_i$  and the internal  $100 \text{ k}\Omega$  resistor. In this case, the gain becomes very inaccurate. If the denominator becomes equal to zero, the system will even become unstable. It is recommended to limit the application of this technique to gain values of 35 or smaller.

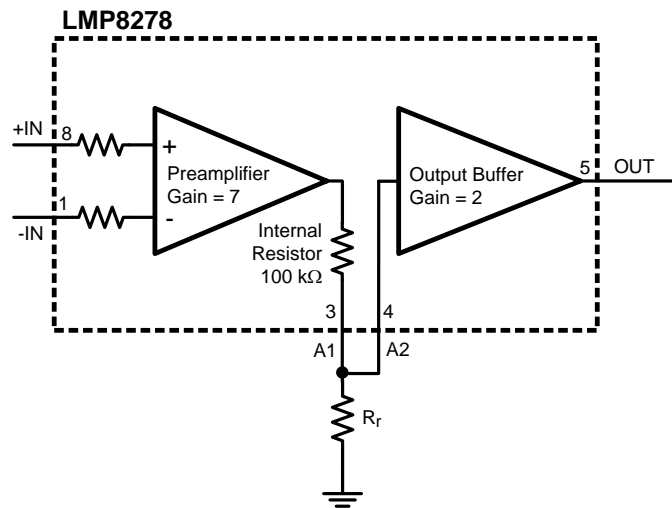

Figure 22. Reduce Gain

Figure 23. Increase Gain

## POWER SUPPLY DECOUPLING

In order to decouple the LMP8278 from AC noise on the power supply, it is recommended to use a 0.1  $\mu\text{F}$  bypass capacitor between the  $V_S$  and GND pins. This capacitor should be placed as close as possible to the supply pins. In some cases an additional 10  $\mu\text{F}$  bypass capacitor may further reduce the supply noise.

## DRIVING SWITCHED CAPACITIVE LOADS

Some ADCs load their signal source with a sample and hold capacitor. The capacitor may be discharged prior to being connected to the signal source. If the LMP8278 is driving such ADCs the sudden current that should be delivered when the sampling occurs may disturb the output signal. This effect was simulated with the circuit shown in [Figure 24](#) where the output is connected to a capacitor that is driven by a rail to rail square wave.

**Figure 24. Driving Switched Capacitive Load**

This circuit simulates the switched connection of a discharged capacitor to the LMP8278 output. The resulting  $V_{OUT}$  disturbance signal is shown in [Figure 25](#).

The figure can be used to estimate the disturbance that will be caused when driving a switched capacitive load. To minimize the error signal introduced by the sampling that occurs on the ADC input, an additional RC filter can be placed in between the LMP8278 and the ADC as illustrated in [Figure 26](#).

The external capacitor absorbs the charge that flows when the ADC sampling capacitor is connected. The external capacitor should be much larger than the sample and hold capacitor at the input of the ADC and the RC time constant of the external filter should be such that the speed of the system is not affected.

**Figure 25. Capacitive Load Response**

**Figure 26. Reduce Error When Driving ADCs**

## LOW SIDE CURRENT SENSING APPLICATION

Figure 27 illustrates a low side current sensing application with a low side driver. The power transistor is pulse width modulated to control the average current flowing through the inductive load which is connected to a relatively high battery voltage. The current through the load is measured across a shunt resistor  $R_{SENSE}$  in series with the load. When the power transistor is on, current flows from the battery through the inductive load, the shunt resistor and the power transistor to ground. In this case, the common mode voltage on the shunt is close to ground. When the power transistor is off, current flows through the inductive load, through the shunt resistor and through the freewheeling diode. In this case the common mode voltage on the shunt is at least one diode voltage drop above the battery voltage. Therefore, in this application the common mode voltage on the shunt is varying between a large positive voltage and a relatively low voltage. Because the large common mode voltage range of the LMP8278 and because of the high AC common mode rejection ratio, the LMP8278 is very well suited for this application.

Figure 27. Low Side Current Sensing Application

## HIGH SIDE CURRENT SENSING APPLICATION

Figure 28 illustrates the application of the LMP8278 in a high side sensing application. This application is similar to the low side sensing discussed above, except in this application the common mode voltage on the shunt drops below ground when the driver is switched off. Because the common mode voltage range of the LMP8278 extends below the negative rail, the LMP8278 is also very well suited for this application.

Figure 28. High Side Current Sensing Application

RF-PA CONTROL APPLICATION

Figure 29 illustrates how the LMP8278 can be used to monitor current flow in an RF power amplifier control application. The fact that the LMP8278 can measure small voltages at a high common mode voltage outside its own supply range makes this part a good choice for such an application. The output signal of the LMP8278 is used as an input for the PA controller. The PA controller can be used to regulate the output power of the RF-PA by measuring the output amplifier supply current.

Figure 29. RF Power Amplifier Control Application

LMP8278QMMX/NOPB	ACTIVE	VSSOP	DGK	8	3500	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 125	AB7A	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LMP8278QMM/NOPB	VSSOP	DGK	8	1000	178.0	12.4	5.3	3.4	1.4	8.0	12.0	Q1

TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
LMP8278QMM/NOPB	VSSOP	DGK	8	1000	210.0	185.0	35.0

DGK (S-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
  - E. Falls within JEDEC MO-187 variation AA, except interlead flash.

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
