

## Large Current External FET Controller Type Switching Regulators

# Single/Dual-output High-frequency Step-down Switching Regulator(Controllertype)

**BD9853AFV**

No.09028EAT05

**●Description**

The BD9853AFV is a 2-ch synchronous DC/DC controller that can operate at a maximum switching frequency of 2MHz, enabling the use of a smaller external coil than conventional lower-frequency switching regulators. This makes the BD9853AFV a suitable choice for downsizing applications.

**●Features**

- 1) Synchronous Switching Regulator Controller 2channels
- 2) FET(Pch/Nch) Direct Drive
- 3) Adjustable Oscillator Frequency with External Resistor (Max. 2MHz)
- 4) Under Voltage Lockout Function (UVLO)
- 5) Thermal Shut Down Function (TSD)
- 6) Short Circuit Protection (SCP)
- 7) Independent ON/OFF Function in Each Channel with Soft Start Pin
- 8) SSOP-B16 Package

**●Applications**

TVSTB, PC, Portable CD · DVD,DVC etc.

**●Absolute Maximum Ratings (Ta = 25°C)**

Parameter	Symbol	Limits	Unit
Supply Voltage (VCC-GND)	Vcc	18	V
VREGA-GND Voltage	VREGA	7	V
VCC-VREGB Voltage	VREGB	7	V
Power Dissipation	Pd	562(*1)	mW
Operating Temperature Range	Topr	-40 to +85	°C
Junction Temperature	Tjmax	+150	°C
Storage Temperature Range	Tstg	-55 to +150	°C

\* Reduced by 4.49mW for each increase in Ta of 1°C over 25°C (When mounted on a board 70×70×1.6mm grass-epoxy PCB)

**●Recommended Operating Conditions**

## ● Pin Description

Pin Number	Pin Name	Pin Descriptions
1	VCC	Input Supply Voltage
2	OUT1H	High Side (Main) FET Driver Output Pin (CH1)
3	OUT1L	Low Side (Synchronous) FET Driver Output Pin (CH1)
4	REGA	Internal Regulator Output Pin (5V Output, 1uF Ceramic Capacitor necessary)
5	RT	Oscillator Frequency Adjustment Pin with external Resistor
6	FB1	Error Amplifier Output Pin (CH1)
7	INV1	Error Amplifier Negative Input Pin (CH1)
8	SCP/SOFT1	Short Circuit Protection · Soft Start Delay Time Setting Pin with External Capacitor (CH1)
9	SCP/SOFT2	Short Circuit Protection · Soft Start Delay Time Setting Pin with External Capacitor (CH2)
10	INV2	Error Amplifier Negative Input Pin (CH2)
11	FB2	Error Amplifier Output Pin (CH2)
12	GND	Ground Pin
13	STB	ON/OFF Control Pin
14	OUT2L	Low Side (Synchronous) FET Driver Output Pin (CH2)
15	OUT2H	High Side (Main) FET Driver Output Pin (CH2)
16	REGB	Internal Regulator Output Pin (VCC-5V Output, 1uF Ceramic Capacitor necessary)

**●Block functional descriptions**

- Triangular wave oscillator  
Connecting the resistor that sets the triangular wave oscillation frequency at the RT terminal generates the triangular wave, which is input into the CH1 and CH2 PWM comparator.
- Error amp  
The INV pin detects the output voltage, compares it to the programmed output voltage and amplifies the difference for output by the FB pin. (The 0.8V reference is the comparison voltage. The tolerance is 1.25%.)
- PWM comparator  
The PWM comparator converts the error amp (FB) voltage into a pulse width modulated waveform that goes to the FET driver and turns FET output ON.
- FET driver  
The push-pull FET driver directly drives the external MOSFET, providing high-side (OUT1H, OUT2H) switching at voltages between  $V_{CC} \leftrightarrow REGB$ , and low-side switching in the  $0 \leftrightarrow REGA$  voltage range. (REGA = 5V; REGB =  $V_{CC} - 5V$  internal power)
- Standby function  
The standby function enables output ON/OFF control by the STB pin. Output is ON when STB voltage is HIGH. With the STB pin set HIGH, the output ON/OFF for each channel can be independently controlled by one of the SCP/SOFT1, 2 pins.
- Soft Start/Short Circuit Protection (SCP)  
Connecting the external capacitor on the SCP/SOFT1, 2 pins sets the SCP delay time and soft start time. When STB is HIGH and the IC starts up, the capacitors on the SCP/SOFT1, 2 pins charge up at 2uA, stabilizing when the system reaches 1.3V. If load conditions change rapidly, causing the output voltage in either channel to fall to 70% or less of the set output voltage (INV voltage 0.56 or lower), the SCP/SOFT1, 2 external capacitors will charge further until output for both channels switches OFF at 2.3V.
- Under Voltage Lockout (UVLO)  
Under Voltage lockout prevents IC malfunctions that could otherwise occur due to intermittent or fluctuating power supply voltage, or insufficient voltage during start-up. When the VCC voltage falls to 4.1V or below, both channel outputs are turned OFF, while the SCP/SOFT1, 2 pins are simultaneously set LOW. The UVLO detection voltage includes 0.1V hysteresis width to prevent malfunctions from input voltage fluctuations.
- Thermal Shutdown (TSD)  
The TSD circuit protects the IC against thermal runaway and heat damage.
- The TSD thermal sensor detects junction temperature. When the temperature reaches the TSD threshold (175°C), the circuit switches the output of both channels OFF, and also switches REGA and REGB OFF. At the same time, it sets the SCP/SOFT1, 2 pins LOW. The hysteresis width (15°C) provided between the TSD function start temperature (threshold) and the stop temperature serves to prevent malfunctions from temperature fluctuations.

●Timing Chart

Fig. 11

●Application component selection and settings

Determining output voltage

Output voltage is determined by dividing the resistance of the external resistors.

$$V_{OUT} = 0.8V \times (1 + R2/R1)$$

determining the oscillation frequency

The oscillation pin is set by the resistor connected to the RT terminal (5 PIN).

Selecting the external MOSFET

In the BD9853AFV design, the main side (OUT1H, OUT2H) is provided with an external PCH FET, while an NCH FET is used on the synchronous rectification side (OUT1L, OUT2L) .

FET selection should be made in conformance with the following relative configurations for maximum drain voltage (VDSS), maximum gate source voltage (VGS), maximum output current, on-resistance RDS (ON) and gate capacitance (Ciss) loss:

- Maximum drain voltage (VDSS) is higher than the IC's maximum input voltage (VIN).
- Maximum gate source voltage is higher than the IC gate driving voltage (REGA, VCC-REGB).
- Maximum output current is higher than the combined maximum load current and coil ripple current ( $\Delta I_L$ ).
- The sum of on-resistance RDS (ON) and gate capacitance (Ciss) conduction loss, together with the switching loss, must not exceed the power dissipation (pd) for the package.

FET conduction loss P<sub>high</sub> and P<sub>low</sub> are defined as follows:

$$P_{high} = I_{out}^2 \times R_{DS(ON)} \times V_{OUT}/V_{IN} \quad (\text{PMOS conduction loss})$$

$$P_{low} = I_{out}^2 \times R_{DS(ON)} \times (1 - V_{OUT}/V_{IN}) \quad (\text{NMOS conduction loss})$$

I<sub>out</sub> : output load current, R<sub>DS(ON)</sub> : FET ON resistance value, V<sub>IN</sub> : input voltage, V<sub>out</sub> : output voltage

FET switching loss P<sub>SW</sub> is calculated as follows:

$$P_{SW} = V_{IN}/2 \times (t_r + t_f) \times f_{osc} \times I_{out}$$

V<sub>IN</sub> : input voltage, t<sub>r</sub> : drain waveform rise time, t<sub>f</sub> : drain waveform fall time, f<sub>osc</sub> : oscillation frequency, I<sub>out</sub> : load current

In addition to the criteria for selecting individual MOSFET components, consideration must also be given to the combination of the PMOS (main side) and NMOS (synchronous side) to be used. The configuration must not generate any through current with PMOS and NMOS both ON at the same time. In order to meet this condition, the following formula must be satisfied, where PCH, NCH MOSFET turn-on delay time is represented as t<sub>dON</sub>, MOSFET turn-off delay time is t<sub>dOFF</sub>, and dead time is t<sub>dt</sub>.

$$t_{dt} > t_{dON} - t_{dOFF}$$

The t<sub>dt</sub> turn-on is (OUTH,OUTL : H→L)70ns typ. Turn-off is (OUTH,OUTL : L→H)70ns typ. Be sure to confirm that the process delay time does not pose problem in terms of the overall MOSFET delay.

The following MOSFETs meet all of the selection criteria outlined above, and are recommended for use. Both are manufactured by ROHM.

PCH: RSS040P03

NCH: RSS065P03

**Selecting the synchronous diode**

An extremely low forward voltage Schottky barrier diode should be employed as the synchronous diode.

Selection of the specific diode to be used should be made in conformance with the following relative configurations for maximum forward current, reverse voltage and diode power dissipation.

- The maximum current rating is higher than the combined maximum load current and coil ripple current ( $\Delta I_L$ ).
- The reverse voltage rating is higher than the  $V_{IN}$  value.
- Power dissipation for the selected diode must be within the rated level.

Synchronous diode power dissipation ( $P_{di}$ ) is expressed in the following formula:

$$P_{di} = I_{out(MAX)} \times t_{dt} \times f_{osc} \times V_f$$

$I_{out(MAX)}$  : maximum load current,  $t_{dt}$  : dead time 60ns typ,  $f_{osc}$  : oscillation frequency,  $V_f$  : forward voltage

**Selecting the output/input coil**

The output coil and the output capacitor together form a second-order smoothing filter for the switch waveform and provide the DC output voltage.

If a coil's inductor value is low, its physical size is minimized, but the penalty is higher ripple current, with lowered efficiency and an increase in output noise. Conversely, a higher inductor value increases the size of the coil, but lowers the ripple current and, consequently, the output ripple current.

Generally speaking, ripple current should be between 20% and 50% of output load current. The following equation is used to calculate the inductor value that corresponds to the ripple current value being employed.

$$L = \frac{(V_{IN} - V_{OUT})}{\Delta I_L} \times \frac{V_{OUT}}{V_{IN}} \times \frac{1}{f_{osc}} \quad \Delta I_L = (0.2 \text{ to } 0.5) \times I_{OUT}$$

$L$  : inductor value,  $V_{IN}$  : maximum input voltage,  $V_{OUT}$  : output voltage,  $\Delta I_L$  : coil ripple current value  
 $f_{osc}$  : oscillation frequency,  $I_{OUT}$  : output load current

Note that the current rating for the coil should be higher than  $I_{OUT(MAX)} + \Delta I_L$ .

**Selecting the input capacitor**

The input capacitor is the source of current that flows to the coil via the FET whenever the high side MOSFET is ON. In selecting an input capacitor, sufficient margin must be provided to accommodate capacitor pressure and the permissible ripple current.

The expression below defines the effective value of the ripple current to the input capacitor. It should be used in determining the suitability of the capacitor in providing sufficient margin for the permissible ripple current.

$$I_{RMS} = I_{OUT} \times \sqrt{(1 - V_{OUT}/V_{IN}) \times V_{OUT}/V_{IN}}$$

$I_{RMS}$  : effective value of the ripple current to the input capacitor

$I_{OUT}$  : output load current

**Selecting the output capacitor**

The output capacitor should confine ESR and permissible ripple current within a stable region.

Although incorporating a low-ESR capacitor will limit ripple voltage and load fluctuation, it can also hurt the stability of the feedback network. Therefore, in order to maintain a stable feedback loop when ceramic or other low-ESR capacitors are employed, special attention must be paid to providing an appropriate phase compensation scheme.

A suitable output capacitor will satisfy the following formula for ESR.

$$ESR \leq \Delta V_L / \Delta I_L$$

$\Delta V_L$  : permissible ripple voltage,  $\Delta I_L$  : coil ripple current

In addition, use the following formula to determine the effective value of the output capacitance permissible ripple current, and select a capacitor that allows sufficient margin to accommodate this value.

$$I_{RMS} = \Delta I_L / 2\sqrt{3}$$

$I_{RMS}$  : effective value of ripple current to the output condenser,  $\Delta I_L$  : coil ripple current

**Setting the soft start time**

To prevent output voltage startup overshoot on either channel, the capacitors connected to the SCP/SOFT 1, 2 pins – in a discharged state at power-on – are gradually charged during a delay interval, thus providing a soft start. The soft start period is the time from when the standby pins go from LOW to HIGH, starting the charge, to the time that the output voltage reaches the programmed setting. The soft start time is calculated in the following equation:

$$t_{soft} = \frac{0.8[V] \text{ (typ)} \times C_{scp/soft} [F]}{I_{soft} \text{ (typ: } 2.3\mu A)[A]}$$

$t_{soft}$  : soft start time,  $C_{scp/soft}$  : SCP/SOFT pin connection capacitance,  $I_{soft}$  : charge current

**Setting the Short Circuit Protection (SCP) delay time**

When the soft start is complete for each channel, the output voltage stabilizes at the set value 1.35V(typ) for the SCP/SOFT1, 2 pins.

When any type of short circuit occurs, the voltage at the point of the fault is reduced. In this case, when voltage at the INV pin falls to 0.56V(typ) or below, the SCP comparator sensor detects the short and further charges the SCP/SOFT pins for the shorted channel from the 1.35V(typ) level. When the SCP/SOFT pins are charged to 2.3V(typ), the Pch/Nch MOSFET is switched OFF.

The elapsed time from the occurrence of the output short to the point the external FET switches OFF is calculated with the following formula:

$$t_{scp} = \frac{0.95[V](typ) \times C_{scp/soft} [F]}{I_{sofsc} (typ: 2.3\mu A)[A]}$$

$t_{scp}$  : SCP delay time,  $C_{scp/soft}$  : SCP/SOFT pin connection capacitance,  $I_{sofsc}$  : charge current

\* If the current more than the capacity of power supply when the short between VOUT and GND occurs, input voltage starts to fall and under voltage lockout (UVLO) is activated at  $V_{in} < 4.15 V$  (typ.). The UVLO has FET driver output (OUT1H, OUT2H, OUT1L, OUT2L) off and external FETs become off. When external FETs are not operating, input voltage returns because of the short between VOUT and GND and the UVLO is canceled. But input voltage starts to fall again because the UVLO is not activated.

There is possibility that a series of behavior "output short → input voltage fall → UVLO activated → external FETs off → input voltage returns → UVLO canceled → output short". So please make provision like inserting FUSE in input line.

**Pin conditions with the only single channel use**

Pin conditions are shown in the following, when the only single channel out of 2 channels is used.

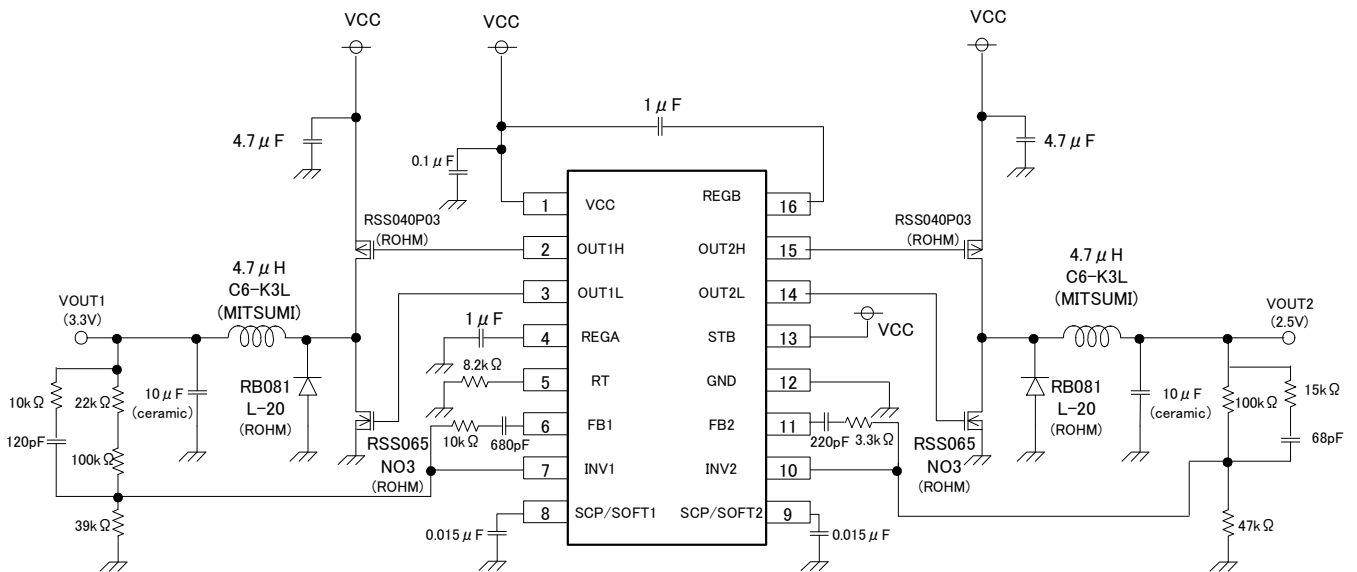

Use only CH1

- SCP/SOFT2, INV2 ⇒ GND short
- FB2, OUT2H, OUT2L ⇒ OPEN

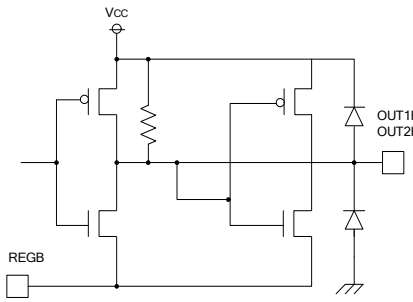

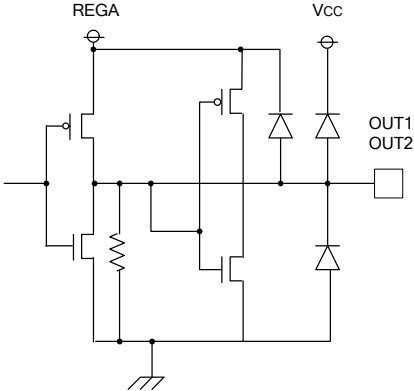

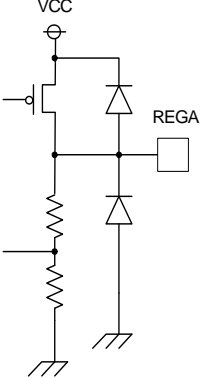

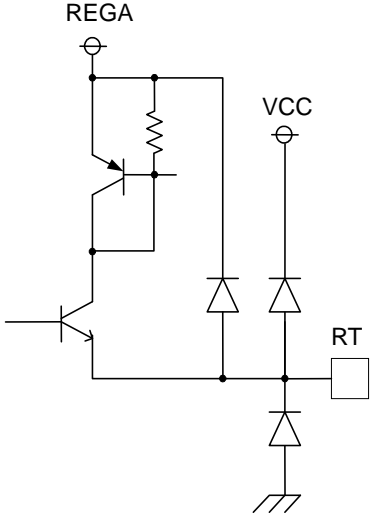

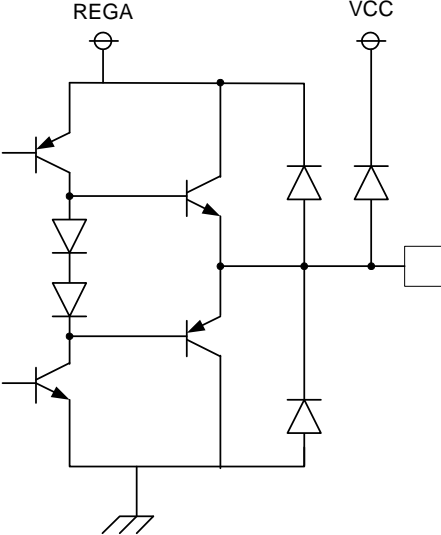

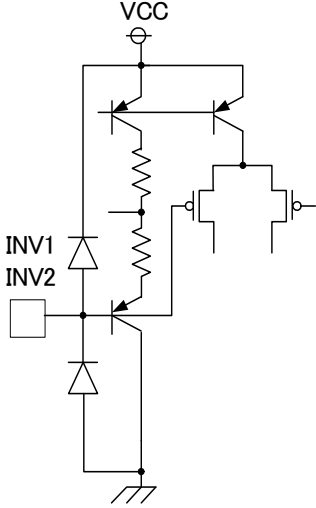

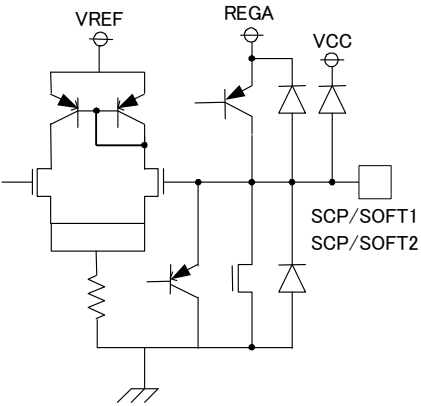

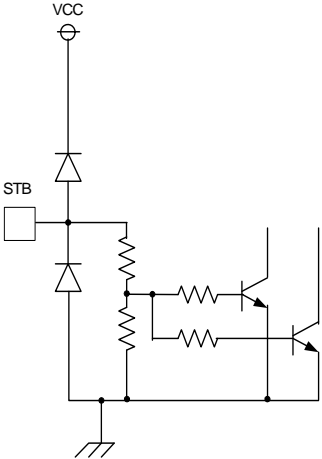

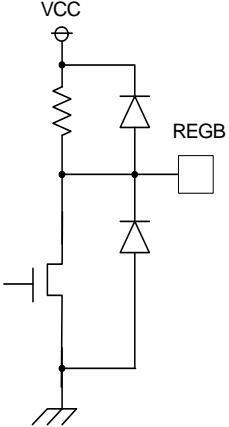

Use only CH2

- SCP/SOFT1, INV1 ⇒ GND short
- FB1, OUT1H, OUT1L ⇒ OPEN

● **Application example**

● I/O Equivalent Circuit

<p>OUT1H(2),OUT2H(15) Max ratings : 7V(from VCC or REGB)</p>	<p>OUT1L(3),OUT2L(14) Max ratings : 7V</p>	<p>REGA(4) Max ratings : 7V</p>
		
<p>RT(5) Max ratings : 7V</p>	<p>FB1(6),FB2(11) Max ratings : 7V</p>	<p>INV1(7),INV2(10) Max ratings : 10V</p>
		
<p>SCP/SOFT1(8),SCP/SOFT2(9) Max ratings : 7V</p>	<p>STB(13) Max ratings : 18V</p>	<p>REGB(16) Max ratings : 7V(from VCC)</p>
		

●Recommended Board Patterns

There are two current loops at the behavior of switching regulator. When laying a pattern on the board, put these elements near to minimize these current loops and make the lines as short and wide as possible. And connect all GND lines at one point to reduce effects caused by above current noise to other lines.

a pattern example of switching part

Place following parts with attention about patterns

- Place CVCC, CREGA, RRT, CREGB as near to the pin as possible.
- Pattern area has to be small enough to reduce parasitic capacitance with RT terminal.

### ●Notes for use

- 1) Absolute maximum ratings  
Use of the IC in excess of absolute maximum ratings such as the applied voltage or operating temperature range may result in IC deterioration or damage. Assumptions should not be made regarding the state of the IC (short mode or open mode) when such damage is suffered. A physical safety measure such as a fuse should be implemented when use of the IC in a special mode where the absolute maximum ratings may be exceeded is anticipated.
- 2) GND potential  
Ensure a minimum GND pin potential in all operating conditions. In addition, ensure that no pins other than the GND pin carry a voltage lower than or equal to the GND pin, including during actual transient phenomena.
- 3) Thermal design  
Use a thermal design that allows for a sufficient margin in light of the power dissipation ( $P_d$ ) in actual operating conditions.
- 4) Inter-pin shorts and mounting errors  
Use caution when orienting and positioning the IC for mounting on printed circuit boards. Improper mounting may result in damage to the IC. Shorts between output pins or between output pins and the power supply and GND pin caused by the presence of a foreign object may result in damage to the IC.
- 5) Operation in a strong electromagnetic field  
Use caution when using the IC in the presence of a strong electromagnetic field as doing so may cause the IC to malfunction.
- 6) Thermal shutdown circuit (TSD circuit)  
This IC incorporates a built-in thermal shutdown circuit (TSD circuit). The TSD circuit is designed only to shut the IC off to prevent runaway thermal operation. Do not continue to use the IC after operating this circuit or use the IC in an environment where the operation of the thermal shutdown circuit is assumed.
- 7) Testing on application boards  
When testing the IC on an application board, connecting a capacitor to a pin with low impedance subjects the IC to stress. Always discharge capacitors after each process or step. Ground the IC during assembly steps as an antistatic measure, and use similar caution when transporting or storing the IC. Always turn the IC's power supply off before connecting it to or removing it from a jig or fixture during the inspection process.
- 8) Common impedance  
Power supply and ground wiring should reflect consideration of the need to lower common impedance and minimize ripple as much as possible (by making wiring as short and thick as possible or rejecting ripple by incorporating inductance and capacitance).
- 9) Applications with modes that reverse VCC and pin potentials may cause damage to internal IC circuits.  
For example, such damage might occur when VCC is shorted with the GND pin while an external capacitor is charged. It is recommended to insert a diode for preventing back current flow in series with VCC or bypass diodes between VCC and each pin.

- 10) Pin short and mistake fitting  
Do not short-circuit between OUT pin and VCC pin, OUT pin and GND pin, or VCC pin and GND pin. When soldering the IC on circuit board, please be unusually cautious about the orientation and the position of the IC.
- 11) Timing resistor and capacitor  
Timing resistor connected between RT and GND, has to be placed near RT terminal. And pattern has to be short enough.

12) IC pin input

This monolithic IC contains P+ isolation and PCB layers between adjacent elements in order to keep them isolated. P/N junctions are formed at the intersection of these P layers with the N layers of other elements to create a variety of parasitic elements. For example, when a resistor and transistor are connected to pins as shown in following chart,

- the P/N junction functions as a parasitic diode when GND > (Pin A) for the resistor or GND > (Pin B) for the transistor (NPN).
- Similarly, when GND > (Pin B) for the transistor (NPN), the parasitic diode described above combines with the N layer of other adjacent elements to operate as a parasitic NPN transistor.

The formation of parasitic elements as a result of the relationships of the potentials of different pins is an inevitable result of the IC's architecture. The operation of parasitic elements can cause interference with circuit operation as well as IC malfunction and damage. For these reasons, it is necessary to use caution so that the IC is not used in a way that will trigger the operation of parasitic elements, such as by the application of voltages lower than the GND (PCB) voltage to input and output pins.

## Precaution on using ROHM Products

- Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment <sup>(Note 1)</sup>, transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
  - Installation of protection circuits or other protective devices to improve system safety
  - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
  - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
  - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
  - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
  - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
  - Sealing or coating our Products with resin or other coating materials
  - Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
  - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- De-rate Power Dissipation (Pd) depending on Ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.
- Confirm that operation temperature is within the specified range described in the product specification.
- ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

## Precaution for Mounting / Circuit board design

- When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- In principle, the reflow soldering method must be used; if flow soldering method is preferred, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

### Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

### Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

### Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
  - [a] the Products are exposed to sea winds or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - [b] the temperature or humidity exceeds those recommended by ROHM
  - [c] the Products are exposed to direct sunshine or condensation
  - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

### Precaution for Product Label

QR code printed on ROHM Products label is for ROHM's internal use only.

### Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

### Precaution for Foreign Exchange and Foreign Trade act

Since our Products might fall under controlled goods prescribed by the applicable foreign exchange and foreign trade act, please consult with ROHM representative in case of export.

### Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data. ROHM shall not be in any way responsible or liable for infringement of any intellectual property rights or other damages arising from use of such information or data.:
2. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the information contained in this document.

### Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

**General Precaution**

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
