

## **NTA Series**

## Isolated 1W Dual Output SM DC-DC Converters

### **FEATURES**

- RoHS compliant
- Efficiency up to 78%
- Wide temperature performance at full 1 Watt load, −40°C to 85°C
- UL 94V-0 Package material
- Footprint over pins 1.64cm<sup>2</sup>
- Lead frame technology
- 3.3V, 5V & 12V Input
- 3.3V, 5V, 9V, 12V & 15V Output
- Internal SMD construction
- Toroidal magnetics
- 1kVDC Isolation 'Hi Pot Test'
- MTTF up to 2.1 Million hours
- Power density 1.36W/cm<sup>3</sup>
- No heatsink required
- Custom solutions available
- Multi-layer ceramic capacitors

### **PRODUCT OVERVIEW**

The NTA series of miniature surface mounted DC-DC Converters employ leadframe technology and transfer moulding techniques to bring all of the benefits of IC style packaging to hybrid circuitry. Co-planarity of the lead positions is based upon IEC 191-6:1990. The devices are suitable for all applications where high volume production is envisaged.

#### **TECHNICAL NOTES**

#### ISOLATION VOLTAGE

'Hi Pot Test', 'Flash Tested', 'Withstand Voltage', 'Proof Voltage', 'Dielectric Withstand Voltage' & 'Isolation Test Voltage' are all terms that relate to the same thing, a test voltage, applied for a specified time, across a component designed to provide electrical isolation, to verify the integrity of that isolation.

Murata Power Solutions NTA series of DC-DC converters are all 100% production tested at their stated isolation voltage. This is 1kVDC for 1 second.

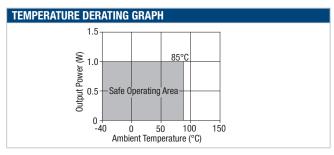

A question commonly asked is, "What is the continuous voltage that can be applied across the part in normal operation?"

For a part holding no specific agency approvals, such as the NTA series, both input and output should normally be maintained within SELV limits i.e. less than 42.4V peak, or 60VDC. The isolation test voltage represents a measure of immunity to transient voltages and the part should never be used as an element of a safety isolation system. The part could be expected to function correctly with several hundred volts offset applied continuously across the isolation barrier; but then the circuitry on both sides of the barrier must be regarded as operating at an unsafe voltage and further isolation/insulation systems must form a barrier between these circuits and any user-accessible circuitry according to safety standard requirements.

#### REPEATED HIGH-VOLTAGE ISOLATION TESTING

It is well known that repeated high-voltage isolation testing of a barrier component can actually degrade isolation capability, to a lesser or greater degree depending on materials, construction and environment. The NTA series has toroidal isolation transformers, with no additional insulation between primary and secondary windings of enamelled wire. While parts can be expected to withstand several times the stated test voltage, the isolation capability does depend on the wire insulation. Any material, including this enamel (typically polyurethane) is susceptible to eventual chemical degradation when subject to very high applied voltages thus implying that the number of tests should be strictly limited. We therefore strongly advise against repeated high voltage isolation testing, but if it is absolutely required, that the voltage be reduced by 20% from specified test voltage.

This consideration equally applies to agency recognised parts rated for better than functional isolation where the wire enamel insulation is always supplemented by a further insulation system of physical spacing or barriers.

1. 12V input types have typically 3% less load regulation change.

#### **Rohs Compliance, MSL and PSL Information**

This series is compatible with RoHS soldering systems and is also backward compatible with Sn/Pb soldering systems. The NTA series has a process, moisture, and reflow sensitivity classification of MSL1 PSL R7F as defined in J-STD-020 and J-STD-075. This translates to: MSL1 = unlimited floor life, PSL R7F = Peak reflow temperature 245°C with a limitation on the time above liquidus (217°C) which for this series is 60sec max. The pin termination finish on this product series is Gold with a plating thickness of 0.05 microns minimum.

For further information please visit www.murata-ps.com/rohs

#### **APPLICATION NOTES**

#### Minimum load

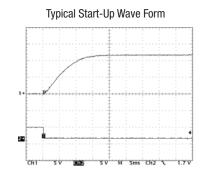

The minimum load to meet datasheet specification is 10% of the full rated load across the specified input voltage range. Lower than 10% minimum loading will result in an increase in output voltage, which may rise to typically double the specified output voltage if the output load falls to less than 5%.

#### Capacitive loading and start up

Typical start up times for this series, with a typical input voltage rise time of  $2.2\mu s$  and output capacitance of  $10\mu F$ , are shown in the table below. The product series will start into a capacitance of  $47\mu F$  with an increased start time, however, the maximum recommended output capacitance is  $10\mu F$ .

|            | Start-up time |
|------------|---------------|
|            | μs            |
| NTA0303MC  | 1630          |
| NTA0305MC  | 1359          |
| NTA0309MC  | 3435          |
| NTA0312MC  | 6590          |
| NTA0315MC  | 25340         |
| NTA0503MC  | 1599          |
| NTA0505MC  | 2185          |
| NTA0505MEC | 1395          |

|           | Start-up time |
|-----------|---------------|
|           | μs            |
| NTA0509MC | 6850          |

#### Ripple & Noise Characterisation Method

Ripple and noise measurements are performed with the following test configuration.

| C1          | 1µF X7R multilayer ceramic capacitor, voltage rating to be a minimum of 3 times the output voltage of the DC-DC converter                                      |
|-------------|--|
| C2          | $10\mu F$ tantalum capacitor, voltage rating to be a minimum of 1.5 times the output voltage of the DC-DC converter with an ESR of less than $100  \text{kHz}$ |
| C3          | 100nF multilayer ceramic capacitor, general purpose  |
| R1          | $450\Omega$ resistor, carbon film, $\pm 1\%$ tolerance   |
| R2          | $50\Omega$ BNC termination   |
| T1          | 3T of the coax cable through a ferrite toroid  |
| RLOAD       | Resistive load to the maximum power rating of the DC-DC converter. Connections should be made via twisted wires  |
| Measured va | lues are multiplied by 10 to obtain the specified values.  |

#### Differential Mode Noise Test Schematic

### **APPLICATION NOTES (continued)**

#### **Output Ripple Reduction**

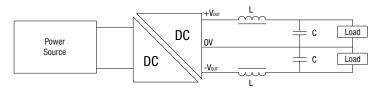

By using the values of inductance and capacitance stated, the output ripple at the rated load is lowered to 5mV p-p max.

#### Component selection

Capacitor: It is required that the ESR (Equivalent Series Resistance) should be as low as possible, ceramic types are recommended.

The voltage rating should be at least twice (except for 15V output), the rated output voltage of the DC-DC converter.

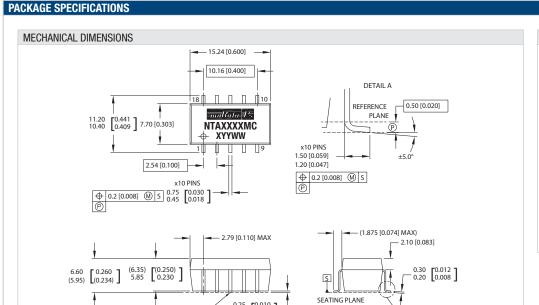

Inductor: The rated current of the inductor should not be less than that of the output of the DC-DC converter. At the rated current, the DC resistance of the inductor should be such that the voltage drop across the inductor is <2% of the rated voltage of the DC-DC converter. The SRF (Self Resonant Frequency) should be >20MHz.

|            |       | Inductor |              | Capacitor |
