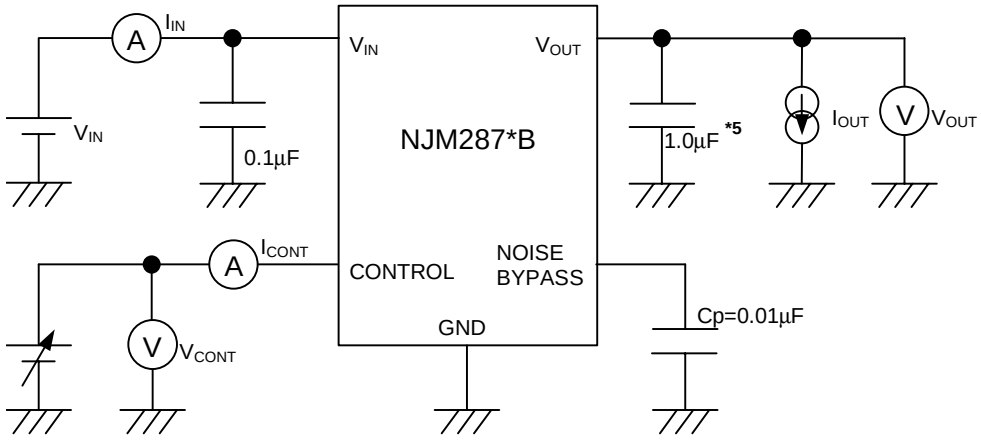
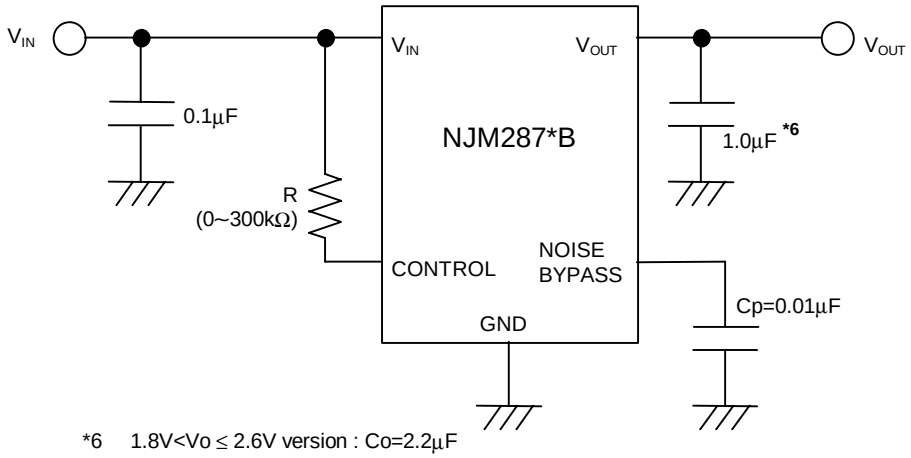
■ TEST CIRCUIT



*5 1.8V<Vo ≤ 2.6V version : Co=2.2μF
Vo≤ 1.8V version : Co=4.7μF

■ TYPICAL APPLICATION

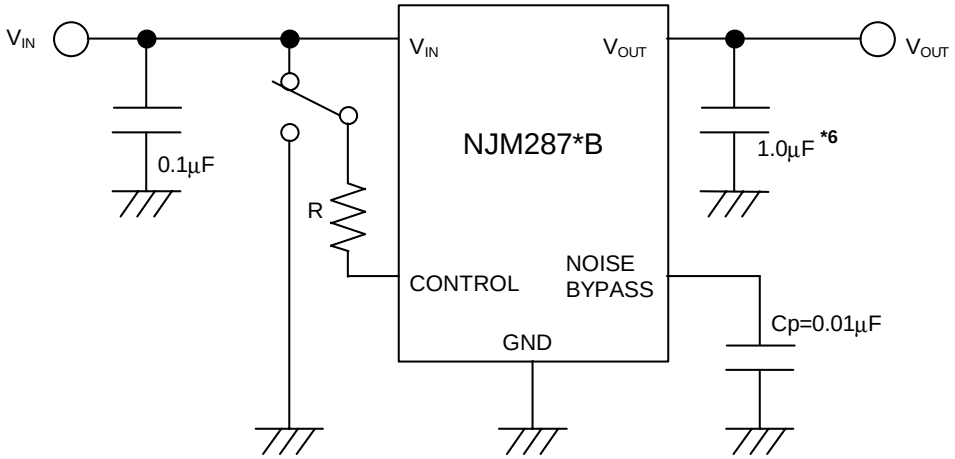
① In the case where ON/OFF Control is not required:



*6 1.8V<Vo ≤ 2.6V version : Co=2.2μF
Vo≤1.8V version : Co=4.7μF

Connect control terminal to V_{IN} terminal

② In use of ON/OFF CONTROL:



*6 1.8V<Vo ≤ 2.6V version : Co=2.2μF(ceramic)
Vo≤1.8V version : Co=4.7μF(ceramic)

State of control terminal:

- "H"→ output is enabled.
- "L" or "open" → output is disabled.

∗Noise bypass Capacitance Cp

Noise bypass capacitance Cp reduces noise generated by band-gap reference circuit. Noise level and ripple rejection will be improved when larger Cp is used. Use of smaller Cp value may cause oscillation.
Use the Cp value of 0.01μF greater to avoid the problem.

∗In the case of using a resistance "R" between V_{IN} and control.

The current flow into the control terminal while the IC is ON state (I_{CONT}) can be reduced when a pull up resistance "R" is inserted between V_{IN} and the control terminal.
The minimum control voltage for ON state ($V_{CONT\,(ON)}$) is increased due to the voltage drop caused by I_{CONT} and the resistance "R". The I_{CONT} is temperature dependence as shown in the "Control Current vs. Temperature" characteristics. Therefore, the resistance "R" should be carefully selected to ensure the control voltage exceeds the $V_{CONT\,(ON)}$ over the required temperature range.
