

MAXIM

Quad Bus LVDS Transceiver

MAX9157

General Description

The MAX9157 is a quad bus LVDS (BLVDS) transceiver for heavily loaded, half-duplex multipoint buses. Small 32-pin QFN and TQFP packages and flow-through pinouts allow the transceiver to be placed near the connector for the shortest possible stub length. The MAX9157 drives LVDS levels into a 27Ω load (double terminated, heavily loaded LVDS bus) at up to 200Mbps. An input fail-safe circuit ensures the receiver output is high when the differential inputs are open, or undriven and shorted, or undriven and terminated. The MAX9157 differential inputs feature 52mV hysteresis for greater immunity to bus noise and reflections. The MAX9157 operates from a single 3.3V supply, consuming 80.9mA supply current with drivers enabled, and 22.7mA with drivers disabled.

The MAX9157's high-impedance I/Os (except for receiver outputs) when $V_{CC} = 0$ or open, combined with glitch-free power-up and power-down, allow hot swapping of cards in multicard bus systems; 7.2pF (max) BLVDS I/O capacitances minimize bus loading.

The MAX9157 is offered in 5mm \times 5mm 32-pin QFN and TQFP packages. The MAX9157 is fully specified for the -40°C to $+85^{\circ}\text{C}$ extended temperature range. Refer to the MAX9129 data sheet for a quad BLVDS driver, ideal for dual multipoint full-duplex buses.

Applications

Add/Drop Muxes	Cellular Phone Base Stations
Digital Cross-Connects	DSLAMs
Network Switches/Routers	Multipoint Buses

Features

- ◆ 32-TQFP and Space-Saving 32-QFN Packages
- ◆ 52mV LVDS Input Hysteresis
- ◆ 1ns (min) Transition Time (0% to 100%) Minimizes Reflections
- ◆ Guaranteed 7.2pF (max) Bus Load Capacitance
- ◆ Glitch-Free Power-Up and Power-Down
- ◆ Hot-Swappable, High-Impedance I/O with $V_{CC} = 0$ or Open
- ◆ Guaranteed 200Mbps Driver Data Rate
- ◆ Fail-Safe Circuit
- ◆ Flow-Through Pinout

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX9157EGJ	-40°C to $+85^{\circ}\text{C}$	32 QFN (5mm \times 5mm)
MAX9157EHJ	-40°C to $+85^{\circ}\text{C}$	32 TQFP (5mm \times 5mm)

Pin Configurations appear at end of data sheet.

Quad Bus LVDS Transceiver

ABSOLUTE MAXIMUM RATINGS

V_{CC}, AV_{CC} to GND-0.3V to +4.0V
 DO₊/RIN₊, DO₋/RIN₋, to GND-0.3V to +4.0V
 DIN₋, DE₋, RE₋ to GND-0.3V to +4.0V
 RO₋ to GND-0.3V to (V_{CC} + 0.3V)
 AGND to GND-0.3V to +0.3V
 Short-Circuit Duration (DO₊/RIN₊, DO₋/RIN₋)Continuous
 Continuous Power Dissipation (T_A = +70°C)
 MAX9157EGJ (derate 21.2mW/°C above +70°C)1702mW

MAX9157EHJ (derate 11.1mW/°C above +70°C)889mW
 Storage Temperature Range-65°C to +150°C
 Maximum Junction Temperature+150°C
 Operating Temperature Range-40°C to +85°C
 ESD Protection
 Human Body Model (DO₊/RIN₊, DO₋/RIN₋)±4kV
 Lead Temperature (soldering, 10s)+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} = 3.0V to 3.6V, R_L = 27Ω ±1%, differential input voltage |V_{ID}| = 0.1V to V_{CC}, input common-mode voltage V_{CM} = 0.05V to 2.4V, input voltage range = 0 to V_{CC}, DE₋ = high, RE₋ = low, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at V_{CC} = 3.3V, |V_{ID}| = 0.2V, V_{CM} = 1.2V, and T_A = +25°C.) (Notes 1 and 2)

Note 1: Current into a pin is defined as positive. Current out of a pin is defined as negative. All voltages are referenced to ground except V_{TH} , V_{TL} , V_{ID} , V_{HYST} , V_{OD} , and ΔV_{OD} .

Note 2: Maximum and minimum limits over temperature are guaranteed by design and characterization. Devices are production tested at $T_A = +25^\circ C$.

Note 3: Guaranteed by design and characterization.

Note 4: Short only one output at a time. Do not exceed the absolute maximum junction temperature specification.

Note 5: C_L includes scope probe and test jig capacitance.

Note 6: t_{SKD1} is the magnitude difference of differential propagation delays in a channel. $t_{SKD1} = |t_{PHLD} - t_{PLHD}|$.

Note 7: t_{CCSK} is the magnitude difference of the t_{PLHD} or t_{PHLD} of one channel and the t_{PLHD} or t_{PHLD} of any other channel on the same part.

Note 8: t_{SKD2} is the magnitude difference of any differential propagation delays between parts operating over rated conditions at the same V_{CC} and within $5^\circ C$ of each other.

Note 9: t_{SKD3} is the magnitude difference of any differential propagation delays between parts operating over rated conditions.

Note 10: Meets data sheet specifications while operating at minimum f_{MAX} rating.

Typical Operating Characteristics

($V_{CC} = 3.3V$, $R_L = 27\Omega$, driver $C_L = 10pF$, receiver $C_L = 15pF$, $|V_{ID}| = 200mV$, $V_{CM} = 1.2V$, $f_{IN} = 20MHz$, $T_A = +25^\circ C$, unless otherwise noted.)

Quad Bus LVDS Transceiver

Quad Bus LVDS Transceiver

Detailed Description

The MAX9157 is a four-channel, 200Mbps, 3.3V BLVDS transceiver in 32-lead TQFP and QFN packages, ideal for driving heavily loaded multipoint buses, typically 16 to 20 cards plugged into a backplane. The MAX9157 receivers accept a differential input and have a fail-safe input circuit. The devices detect differential signals as low as 100mV and as high as V_{CC} .

The MAX9157 driver outputs use a current-steering configuration to generate a 9.25mA to 17mA output current. This current-steering approach induces less ground bounce and no shoot-through current, enhancing noise margin and system speed performance. The outputs are short-circuit current limited.

The MAX9157 current-steering output requires a resistive load to terminate the signal and complete the transmission loop. Because the devices switch the direction of current flow and not voltage levels, the output voltage swing is determined by the value of the termination resistor multiplied by the output current. With a typical 15mA output current, the MAX9157 produces a 405mV output voltage when driving a bus terminated with two 54 Ω resistors ($15\text{mA} \times 27\Omega = 405\text{mV}$). Logic states are determined by the direction of current flow through the termination resistor.

Fail-Safe Receiver Inputs

The fail-safe feature of the MAX9157 sets the output high when the differential input is:

- Open
- Undriven and shorted
- Undriven and terminated

Without a fail-safe circuit, when the input is undriven, noise at the input may switch the outputs and it may appear to the system that data is being sent. Open or undriven terminated input conditions can occur when a cable is disconnected or cut, or when driver output is in high impedance. A shorted input can occur because of a cable failure.

When the input is driven with a differential signal with a common-mode voltage of 0.05V to 2.4V, the fail-safe circuit is not activated. If the input is open, undriven and shorted, or undriven and parallel terminated, an internal resistor in the fail-safe circuit pulls both inputs above $V_{CC} - 0.3\text{V}$, activating the fail-safe circuit and forcing the outputs high (Figure 1).

Effect of Capacitive Loading

The characteristic impedance of a differential PC board trace is uniformly reduced when equal capacitive loads are attached at equal intervals (provided the transition time of the signal being driven on the trace is longer than the delay between loads). This kind of loading is typical of multipoint buses where cards are attached at 1in or 0.8in intervals along the length of a backplane.

The reduction in characteristic impedance is approximated by the following formula:

$$Z_{\text{DIFF-loaded}} = Z_{\text{DIFF-unloaded}} \times \sqrt{\frac{C_o}{C_o + N \times C_L / L}}$$

where:

$Z_{\text{DIFF-unloaded}}$ = unloaded differential characteristic impedance

C_o = unloaded trace capacitance (pF/unit length)

C_L = value of each capacitive load (pF)

N = number of capacitive loads

L = trace length

For example, if $C_o = 2.5\text{pF/in}$, $C_L = 10\text{pF}$, $N = 18$, $L = 18\text{in}$, and $Z_{\text{DIFF-unloaded}} = 120\Omega$, the loaded differential impedance is:

$$\begin{aligned} Z_{\text{DIFF-loaded}} &= 120\Omega \times \\ &\sqrt{2.5\text{pF} / (2.5\text{pF} + 18 \times 10\text{pF} / 18\text{in})} \\ Z_{\text{DIFF-loaded}} &= 54\Omega \end{aligned}$$

In this example, capacitive loading reduces the characteristic impedance from 120 Ω to 54 Ω . The load seen by

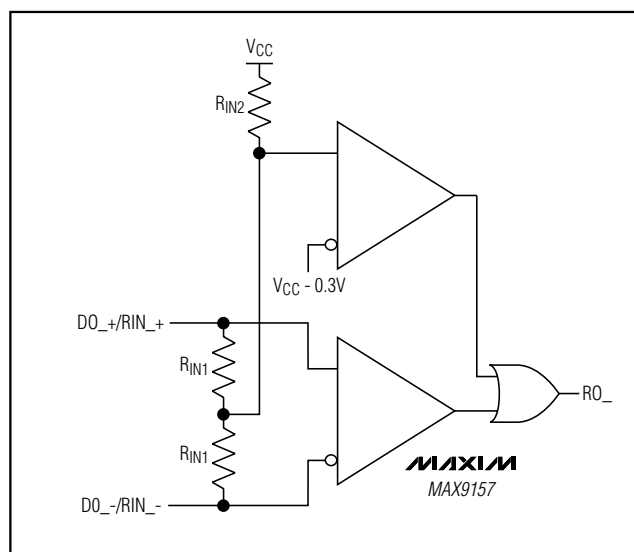

Figure 1. Internal Fail-Safe Circuit

Quad Bus LVDS Transceiver

a driver located on a card in the middle of the bus is 27Ω because the driver sees two 54Ω loads in parallel. A typical LVDS driver (rated for a 100Ω load) would not develop a large enough differential signal to be reliably detected by an LVDS receiver. The MAX9157 BLVDS drivers are designed and specified to drive a 27Ω load to differential voltage levels of 250mV to 460mV. A standard LVDS receiver is able to detect this level of differential signal. Short extensions off the bus, called stubs, contribute to capacitive loading. Keep stubs less than 1in for a good balance between ease of component placement and good signal integrity.

The MAX9157 driver outputs are current-source drivers and drive larger differential signal levels into loads lighter than 27Ω and smaller levels into loads heavier than 27Ω (see *Typical Operating Characteristics* curves). To keep loading from reducing bus impedance below the rated 27Ω load, PC board traces can be designed for higher unloaded characteristic impedance.

Effect of Transition Times

For transition times (measured from 0% to 100%) shorter than the delay between capacitive loads, the loads are seen as low-impedance discontinuities from which the driven signal is reflected. Reflections add and subtract from the signal being driven and cause decreased noise margin and jitter. The MAX9157 output drivers are designed for a minimum transition time of 1ns (rated 0.6ns from 20% to 80%, or about 1ns from 0% to 100%) to reduce reflections while being fast enough for high-speed backplane data transmission.

Power-On Reset

The power-on reset voltage of the MAX9157 is typically 2.25V. When the supply falls below this voltage, the devices are disabled and the receiver inputs/driver outputs are in high impedance. The power-on reset ensures glitch-free power-up and power-down, allowing hot swapping of cards in a multcard bus system without disrupting communications.

Receiver Input Hysteresis

The MAX9157 receiver inputs feature 52mV hysteresis to increase noise immunity for low-differential input signals.

Operating Modes

The MAX9157 features driver/receiver enable inputs that select the bus I/O function (Table 1). Tables 2 and 3 show the driver and receiver truth tables.

Input Internal Pullup/Pulldown Resistors

The MAX9157 includes pullup or pulldown resistors ($300k\Omega$) to ensure that unconnected inputs are defined (Table 4).

Applications Information

Supply Bypassing

Bypass each supply pin with high-frequency surface-mount ceramic 0.1 μ F and 1nF capacitors in parallel as close to the device as possible, with the smaller value capacitor closest to the device.

Termination

In the example given in the *Effect of Capacitive Loading* section, the loaded differential impedance of a bus is reduced to 54Ω . Since the bus can be driven from any card position, the bus must be terminated at each end. A parallel termination of 54Ω at each end of the bus placed across the traces that make up the differential pair provides a proper termination. The total load seen by the driver is 27Ω . The MAX9157 drives higher differential signal levels into lighter loads. (See Differential Output Voltage vs. Output Load graph in the *Typical Operating Characteristics* section). A multidrop bus with the driver at one end and receivers connected at regular intervals along the bus has a lowered impedance due to capacitive loading. Assuming a 54Ω impedance, the multidrop bus can be terminated with a single, parallel-connected 54Ω resistor at the far end from the driver. Only a single resistor is required because the driver sees one 54Ω differential trace. The signal swing is larger with a 54Ω load. In general, parallel terminate each end of the bus with a resistor

Table 1. I/O Enable Functional Table

MODE SELECTED	DE _‾	RE _‾
Driver Mode	H	H
Receiver Mode	L	L
High-Impedance Mode	L	H
Loopback Mode	H	L

Table 2. Driver Mode

INPUTS		OUTPUTS	
DE _‾	DIN _‾	DO _‾ + / RIN _‾ +	DO _‾ - / RIN _‾ -
H	L	L	H
H	H	H	L
L	X	Z	Z

Quad Bus LVDS Transceiver

Table 3. Receiver Mode

INPUTS		OUTPUTS
\overline{RE}_-	$V_{ID} = (V_{DO_+}/R_{IN_+}) - (V_{DO_-}/R_{IN_-})$	RO_-
L	$V_{ID} < -100mV$	L
L	$V_{ID} > 100mV$	H
L	Fail-safe operation guaranteed when DO_+/R_{IN_+} and DO_-/R_{IN_-} are open, undriven and shorted, or undriven and parallel terminated	H
H	X	Z

Table 4. Input Internal Pullup/Pulldown Resistors

PIN	INTERNAL RESISTOR
DE12	Pulldown to GND
DE34	Pulldown to GND
\overline{RE}_{12}	Pullup to V_{CC}
\overline{RE}_{34}	Pullup to V_{CC}
DIN_-	Pullup to V_{CC}

matching the differential impedance of the bus (taking into account any reduced impedance due to loading).

Traces, Cables, and Connectors

The characteristics of input and output connections affect the performance of the MAX9157. Use controlled-impedance traces, cables, and connectors with matched characteristic impedance.

Ensure that noise couples as common mode by running the traces of a differential pair close together. Reduce within-pair skew by matching the electrical length of the traces of a differential pair. Excessive skew can result in a degradation of magnetic field cancellation. Maintain the distance between traces of a differential pair to avoid discontinuities in differential impedance. Minimize the number of vias to further prevent impedance discontinuities.

Avoid the use of unbalanced cables, such as ribbon cable. Balanced cables, such as twisted pair, offer superior signal quality and tend to generate less EMI due to canceling effects. Balanced cables tend to pick up noise as common mode, which is rejected by the receiver.

Board Layout

A four-layer PC board that provides separate power, ground, input, and output signals is recommended. Keep the LVTTTL/LVCMOS and BLVDS signals separated to prevent coupling.

NOTES:

1. DIE THICKNESS ALLOWABLE IS 0.305mm MAXIMUM (.012 INCHES MAXIMUM)
2. DIMENSIONING & TOLERANCES CONFORM TO ASME Y14.5M. – 1994.
3. N IS THE NUMBER OF TERMINALS.
Nd IS THE NUMBER OF TERMINALS IN X-DIRECTION &
Ne IS THE NUMBER OF TERMINALS IN Y-DIRECTION.
4. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.20 AND 0.25mm FROM TERMINAL TIP.
5. THE PIN #1 IDENTIFIER MUST BE EXISTED ON THE TOP SURFACE OF THE PACKAGE BY USING INDENTATION MARK OR INK/ LASER MARKED.
6. EXACT SHAPE AND SIZE OF THIS FEATURE IS OPTIONAL.
7. ALL DIMENSIONS ARE IN MILLIMETERS.
8. PACKAGE WARPAGE MAX 0.05mm.
9. APPLIED FOR EXPOSED PAD AND TERMINALS.
EXCLUDE EMBEDDED PART OF EXPOSED PAD FROM MEASURING.
10. MEETS JEDEC MO220.
11. THIS PACKAGE OUTLINE APPLIES TO ANVIL SINGULATION (STEPPED SIDES) AND TO SAW SINGULATION (STRAIGHT SIDES) QFN STYLES.
