

1-MHz, Micro-Power, Low-Noise, RRIO, 1.8-V CMOS OPERATIONAL AMPLIFIER Precision Value Line Series

Check for Samples: [OPA313](#), [OPA2313](#), [OPA4313](#)

FEATURES

- **Low I_Q :** 50 $\mu\text{A}/\text{ch}$
- **Wide Supply Range:** 1.8 V to 5.5 V
- **Low Noise:** 25 $\text{nV}/\sqrt{\text{Hz}}$ at 1 kHz
- **Gain Bandwidth:** 1 MHz
- **Low Input Bias Current:** 0.2 pA
- **Low Offset Voltage:** 0.5 mV
- **Unity-Gain Stable**
- **Internal RF/EMI Filter**
- **Extended Temperature Range:**
–40°C to +125°C

APPLICATIONS

- **Battery-Powered Instruments:**
 - Consumer, Industrial, Medical
 - Notebooks, Portable Media Players
- **Sensor Signal Conditioning:**
 - Loop-Powered
 - Notebooks, Portable Media Players
- **Wireless Sensors:**
 - Home Security
 - Remote Sensing
 - Wireless Metering

DESCRIPTION

The OPA313 family of single-, dual-, and quad-channel op amps represents a new generation of low-cost, general purpose, micro-power operational amplifiers. Featuring rail-to-rail input and output swings, and low quiescent current (50 μA , typ) combined with a wide bandwidth of 1 MHz and very low noise (25 $\text{nV}/\sqrt{\text{Hz}}$ at 1 kHz) makes this family very attractive for a variety of battery-powered applications that require a good balance between cost and performance. The low input bias current supports those op amps to be used in applications with megaohm source impedances.

The robust design of the OPA313 devices provides ease-of-use to the circuit designer: unity-gain stability with capacitive loads of up to 150 pF, integrated RF/EMI rejection filter, no phase reversal in overdrive conditions, and high electrostatic discharge (ESD) protection (4-kV HBM).

These devices are optimized for operation at voltages as low as +1.8 V (± 0.9 V) and up to +5.5 V (± 2.75 V), and are specified over the extended temperature range of –40°C to +125°C.

The OPA313 (single) is available in both SC70-5 and SOT23-5 packages. The OPA2313 (dual) is offered in SO-8, MSOP-8, and DFN-8 packages. The quad-channel OPA4313 is offered in a TSSOP-14 package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE INFORMATION⁽¹⁾

PRODUCT	PACKAGE-LEAD	PACKAGE DESIGNATOR	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING
OPA313	SC70-5	DCK	–40°C to +125°C	SIE
	SOT23-5	DBV	–40°C to +125°C	SIF
OPA2313	SO-8	D	–40°C to +125°C	OP2313
	MSOP-8	DGK	–40°C to +125°C	OUSS
	DFN-8	DRG	–40°C to +125°C	SDY
OPA4313	TSSOP-14	PW	–40°C to +125°C	OPA4313

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Over operating free-air temperature range, unless otherwise noted.

		OPA313, OPA2313, OPA4313	UNIT
Supply voltage		7	V
Signal input terminals	Voltage ⁽²⁾	(V–) – 0.5 to (V+) + 0.5	V
	Current ⁽²⁾	±10	mA
Output short-circuit ⁽³⁾		Continuous	mA
Operating temperature, T _A		–40 to +150	°C
Storage temperature, T _{stg}		–65 to +150	°C
Junction temperature, T _J		+150	°C
ESD rating	Human body model (HBM)	4000	V
	Charged device model (CDM)	1000	V
	Machine model (MM)	200	V

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.
- (2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5 V beyond the supply rails should be current limited to 10 mA or less.
- (3) Short-circuit to ground, one amplifier per package.

ELECTRICAL CHARACTERISTICS: +5.5 V⁽¹⁾

 At $T_A = +25^\circ\text{C}$, $R_L = 10\text{ k}\Omega$ connected to $V_S / 2$, and $V_{CM} = V_{OUT} = V_S / 2$, unless otherwise noted.

PARAMETER		TEST CONDITIONS	OPA313, OPA2313, OPA4313			UNIT
			MIN	TYP	MAX	
OFFSET VOLTAGE						
V_{OS}	Input offset voltage			0.5	2.5	mV
dV_{OS}/dT	vs Temperature	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$		2		$\mu\text{V}/^\circ\text{C}$
PSRR	vs power supply	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	74	90		dB
	Channel separation, dc	At dc		10		$\mu\text{V}/\text{V}$
INPUT VOLTAGE RANGE						
V_{CM}	Common-mode voltage range	No phase reversal, rail-to-rail input	$(V_-) - 0.2$		$(V_+) + 0.2$	V
CMRR	Common-mode rejection ratio	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $(V_{S-}) - 0.2\text{ V} < V_{CM} < (V_{S+}) - 1.3\text{ V}$	70	85		dB
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{CM} = -0.2\text{ V}$ to 5.7 V	64	80		dB
INPUT BIAS CURRENT						
I_B	Input bias current			± 0.2	± 10	pA
		$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}^{(2)}$			± 50	pA
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}^{(2)}$			± 600	pA
I_{OS}	Input offset current			± 0.2	± 10	pA
		$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}^{(2)}$			± 50	pA
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}^{(2)}$			± 600	pA
NOISE						
	Input voltage noise (peak-to-peak)	$f = 0.1\text{ Hz}$ to 10 Hz		6		μV_{PP}
e_n	Input voltage noise density	$f = 10\text{ kHz}$		22		$\text{nV}/\sqrt{\text{Hz}}$
		$f = 1\text{ kHz}$		25		$\text{nV}/\sqrt{\text{Hz}}$
i_n	Input current noise density	$f = 1\text{ kHz}$		5		$\text{fA}/\sqrt{\text{Hz}}$
INPUT CAPACITANCE						
C_{IN}	Differential			1		pF
	Common-mode			5		pF
OPEN-LOOP GAIN						
A_{OL}	Open-loop voltage gain	$0.05\text{ V} < V_O < (V_+) - 0.05\text{ V}$, $R_L = 100\text{ k}\Omega$	90	104		dB
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $0.1\text{ V} < V_O < (V_+) - 0.1\text{ V}$	104	116		dB
		$0.3\text{ V} < V_O < (V_+) - 0.3\text{ V}$, $R_L = 2\text{ k}\Omega$	100	110		dB
	Phase margin	$V_S = 5.0\text{ V}$, $G = +1$		65		degrees

- (1) Parameters with minimum or maximum specification limits are 100% production tested at $+25^\circ\text{C}$, unless otherwise noted. Over temperature limits are based on characterization and statistical analysis.
- (2) Specified by design and characterization; not production tested.

ELECTRICAL CHARACTERISTICS: +5.5 V⁽¹⁾ (continued)

At $T_A = +25\text{ }^\circ\text{C}$, $R_L = 10\text{ k}\Omega$ connected to $V_S / 2$, and $V_{CM} = V_{OUT} = V_S / 2$, unless otherwise noted.

PARAMETER		TEST CONDITIONS	OPA313, OPA2313, OPA4313			UNIT
			MIN	TYP	MAX	
FREQUENCY RESPONSE						
GBW	Gain-bandwidth product	$V_S = 5.0\text{ V}$, $C_L = 10\text{ pF}$		1		MHz
SR	Slew rate	$V_S = 5.0\text{ V}$, $G = +1$		0.5		V/ μs
t_s	Settling time	To 0.1%, $V_S = 5.0\text{ V}$, 2-V step, $G = +1$		5		μs
		To 0.01%, $V_S = 5.0\text{ V}$, 2-V step, $G = +1$		6		μs
	Overload recovery time	$V_S = 5.0\text{ V}$, $V_{IN} \times \text{Gain} > V_S$		3		μs
THD+N	Total harmonic distortion + noise ⁽³⁾	$V_S = 5.0\text{ V}$, $V_O = 1\text{ V}_{RMS}$, $G = +1$, $f = 1\text{ kHz}$		0.0045%		
OUTPUT						
V_O	Voltage output swing from supply rails	$R_L = 100\text{ k}\Omega$ ⁽⁴⁾		5	20	mV
		$T_A = -40\text{ }^\circ\text{C}$ to $+125\text{ }^\circ\text{C}$, $R_L = 100\text{ k}\Omega$ ⁽⁴⁾			30	mV
		$R_L = 2\text{ k}\Omega$ ⁽⁴⁾		75	100	mV
		$T_A = -40\text{ }^\circ\text{C}$ to $+125\text{ }^\circ\text{C}$, $R_L = 2\text{ k}\Omega$			125	mV
I_{SC}	Short-circuit current			± 15		mA
		$T_A = -40\text{ }^\circ\text{C}$ to $+125\text{ }^\circ\text{C}$			± 12	mA

APPLICATION INFORMATION

The OPA313 is a family of low-power, rail-to-rail input and output operational amplifiers specifically designed for portable applications. These devices operate from 1.8 V to 5.5 V, are unity-gain stable, and suitable for a wide range of general-purpose applications. The class AB output stage is capable of driving $\leq 10\text{-k}\Omega$ loads connected to any point between V_+ and ground. The input common-mode voltage range includes both rails, and allows the OPA313 family to be used in virtually any single-supply application. Rail-to-rail input and output swing significantly increases dynamic range, especially in low-supply applications, and makes them ideal for driving sampling analog-to-digital converters (ADCs).

The OPA313 features 1-MHz bandwidth and $0.5\text{-V}/\mu\text{s}$ slew rate with only $50\text{-}\mu\text{A}$ supply current per channel, providing good ac performance at very low power consumption. DC applications are also well served with a low input noise voltage of $25\text{ nV}/\sqrt{\text{Hz}}$ at 1 kHz, low input bias current (0.2 pA), and an input offset voltage of 0.5 mV (typical). The typical offset voltage drift is $2\text{ }\mu\text{V}/^\circ\text{C}$; over the full temperature range the input offset voltage changes only $200\text{ }\mu\text{V}$ (0.5 mV to 0.7 mV).

OPERATING VOLTAGE

The OPA313 series op amps are fully specified and ensured for operation from $+1.8\text{ V}$ to $+5.5\text{ V}$. In addition, many specifications apply from -40°C to $+125^\circ\text{C}$. Parameters that vary significantly with operating voltages or temperature are shown in the [Typical Characteristics](#) graphs. Power-supply pins should be bypassed with $0.01\text{-}\mu\text{F}$ ceramic capacitors.

RAIL-TO-RAIL INPUT

The input common-mode voltage range of the OPA313 series extends 200 mV beyond the supply rails. This performance is achieved with a complementary input stage: an N-channel input differential pair in parallel with a P-channel differential pair, as shown in [Figure 34](#). The N-channel pair is active for input voltages close to the positive rail, typically $(V_+) - 1.3\text{ V}$ to 200 mV above the positive supply, while the P-channel pair is on for inputs from 200 mV below the negative supply to approximately $(V_+) - 1.3\text{ V}$. There is a small transition region, typically $(V_+) - 1.4\text{ V}$ to $(V_+) - 1.2\text{ V}$, in which both pairs are on. This 200-mV transition region can vary up to 300 mV with process variation. Thus, the transition region (both stages on) can range from $(V_+) - 1.7\text{ V}$ to $(V_+) - 1.5\text{ V}$ on the low end, up to $(V_+) - 1.1\text{ V}$ to $(V_+) - 0.9\text{ V}$ on the high end. Within this transition region, PSRR, CMRR, offset voltage, offset drift, and THD may be degraded compared to device operation outside this region.

Figure 34. Simplified Schematic

INPUT AND ESD PROTECTION

The OPA313 family incorporates internal electrostatic discharge (ESD) protection circuits on all pins. In the case of input and output pins, this protection primarily consists of current-steering diodes connected between the input and power-supply pins. These ESD protection diodes also provide in-circuit, input overdrive protection, as long as the current is limited to 10 mA as stated in the [Absolute Maximum Ratings](#). [Figure 35](#) shows how a series input resistor may be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and its value should be kept to a minimum in noise-sensitive applications.

Figure 35. Input Current Protection

COMMON-MODE REJECTION RATIO (CMRR)

CMRR for the OPA313 is specified in several ways so the best match for a given application may be used; see the [Electrical Characteristics](#). First, the CMRR of the device in the common-mode range below the transition region [$V_{CM} < (V+) - 1.3 \text{ V}$] is given. This specification is the best indicator of the capability of the device when the application requires use of one of the differential input pairs. Second, the CMRR over the entire common-mode range is specified at ($V_{CM} = -0.2 \text{ V to } 5.7 \text{ V}$). This last value includes the variations seen through the transition region (see [Figure 7](#)).

EMI SUSCEPTIBILITY AND INPUT FILTERING

Operational amplifiers vary with regard to the susceptibility of the device to electromagnetic interference (EMI). If conducted EMI enters the op amp, the dc offset observed at the amplifier output may shift from its nominal value while EMI is present. This shift is a result of signal rectification associated with the internal semiconductor junctions. While all op amp pin functions can be affected by EMI, the signal input pins are likely to be the most susceptible. The OPA313 operational amplifier family incorporate an internal input low-pass filter that reduces the amplifiers response to EMI. Both common-mode and differential mode filtering are provided by this filter. The filter is designed for a cutoff frequency of approximately 35 MHz (–3 dB), with a roll-off of 20 dB per decade.

Texas Instruments has developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10 MHz to 6 GHz. The EMI rejection ratio (EMIRR) metric allows op amps to be directly compared by the EMI immunity. [Figure 33](#) illustrates the results of this testing on the OPA313 family. Detailed information can also be found in the application report, *EMI Rejection Ratio of Operational Amplifiers* ([SBOA128](#)), available for download from www.ti.com.

RAIL-TO-RAIL OUTPUT

Designed as a micro-power, low-noise operational amplifier, the OPA313 delivers a robust output drive capability. A class AB output stage with common-source transistors is used to achieve full rail-to-rail output swing capability. For resistive loads up to 10 kΩ, the output swings typically to within 5 mV of either supply rail regardless of the power-supply voltage applied. Different load conditions change the ability of the amplifier to swing close to the rails; refer to the typical characteristic graph, [Output Voltage Swing vs Output Current](#).

CAPACITIVE LOAD AND STABILITY

The OPA313 is designed to be used in applications where driving a capacitive load is required. As with all op amps, there may be specific instances where the OPA313 can become unstable. The particular op amp circuit configuration, layout, gain, and output loading are some of the factors to consider when establishing whether or not an amplifier is stable in operation. An op amp in the unity-gain (+1-V/V) buffer configuration that drives a capacitive load exhibits a greater tendency to be unstable than an amplifier operated at a higher noise gain. The capacitive load, in conjunction with the op amp output resistance, creates a pole within the feedback loop that degrades the phase margin. The degradation of the phase margin increases as the capacitive loading increases. When operating in the unity-gain configuration, the OPA313 remains stable with a pure capacitive load up to approximately 1 nF. The equivalent series resistance (ESR) of some very large capacitors (C_L greater than 1 μ F) is sufficient to alter the phase characteristics in the feedback loop such that the amplifier remains stable. Increasing the amplifier closed-loop gain allows the amplifier to drive increasingly larger capacitance. This increased capability is evident when observing the overshoot response of the amplifier at higher voltage gains. See the typical characteristic graph, [Small-Signal Overshoot vs. Capacitive Load](#).

One technique for increasing the capacitive load drive capability of the amplifier operating in a unity-gain configuration is to insert a small resistor, typically 10 Ω to 20 Ω , in series with the output, as shown in [Figure 36](#). This resistor significantly reduces the overshoot and ringing associated with large capacitive loads. One possible problem with this technique, however, is that a voltage divider is created with the added series resistor and any resistor connected in parallel with the capacitive load. The voltage divider introduces a gain error at the output that reduces the output swing.

Figure 36. Improving Capacitive Load Drive

DFN PACKAGE

The OPA2313 (dual version) uses the DFN style package (also known as SON); this package is a QFN with contacts on only two sides of the package bottom. This leadless package maximizes printed circuit board (PCB) space and offers enhanced thermal and electrical characteristics through an exposed pad. One of the primary advantages of the DFN package is its low, 0.9-mm height. DFN packages are physically small, have a smaller routing area, improved thermal performance, reduced electrical parasitics, and use a pinout scheme that is consistent with other commonly-used packages, such as SO and MSOP. Additionally, the absence of external leads eliminates bent-lead issues.

The DFN package can easily be mounted using standard PCB assembly techniques. See Application Note, [QFN/SON PCB Attachment \(SLUA271\)](#) and Application Report, [Quad Flatpack No-Lead Logic Packages \(SCBA017\)](#), both available for download from www.ti.com.

NOTE

The exposed leadframe die pad on the bottom of the DFN package should be connected to the most negative potential (V-).

APPLICATION EXAMPLES

GENERAL CONFIGURATIONS

When receiving low-level signals, limiting the bandwidth of the incoming signals into the system is often required. The simplest way to establish this limited bandwidth is to place an RC filter at the noninverting terminal of the amplifier, as [Figure 37](#) shows.

$$f_{-3\text{ dB}} = \frac{1}{2\pi R_1 C_1}$$

$$\frac{V_{\text{OUT}}}{V_{\text{IN}}} = \left(1 + \frac{R_F}{R_G}\right) \left(\frac{1}{1 + sR_1 C_1}\right)$$

Figure 37. Single-Pole Low-Pass Filter

If even more attenuation is needed, a multiple pole filter is required. The Sallen-Key filter can be used for this task, as [Figure 38](#) shows. For best results, the amplifier should have a bandwidth that is eight to 10 times the filter frequency bandwidth. Failure to follow this guideline can result in phase shift of the amplifier.

$$\begin{aligned} R_1 &= R_2 = R \\ C_1 &= C_2 = C \\ Q &= \text{Peaking factor} \\ &(\text{Butterworth } Q = 0.707) \end{aligned}$$

$$f_{-3\text{ dB}} = \frac{1}{2\pi RC}$$

$$R_G = \frac{R_F}{\left(2 - \frac{1}{Q}\right)}$$

Figure 38. Two-Pole Low-Pass Sallen-Key Filter

REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (December 2012) to Revision C	Page
• Changed first Open-Loop Gain, A_{OL} typical specification in Electrical Characteristics: +5.5 V table	3
• Updated Figure 10	11
• Updated Figure 19 through Figure 22	12

Changes from Revision A (September 2012) to Revision B	Page
• Changed title of document	1
• Changed third paragraph of Description section	1
• Changed title of Electrical Characteristics: +5.5 V table	3
• Deleted middle two rows from Input Voltage Range, $CMRR$ parameter in Electrical Characteristics: +5.5 V table	3
• Changed test conditions of Input Voltage Range, $CMRR$ parameter in Electrical Characteristics: +5.5 V table	3
• Added footnote to Input Bias Current, I_B and I_{OS} parameters in Electrical Characteristics: +5.5 V table	3
• Changed Open-Loop Gain, A_{OL} parameter in Electrical Characteristics: +5.5 V table	3
• Deleted first row from Frequency Response, GBW parameter in Electrical Characteristics: +5.5 V table	4
• Deleted first row from Frequency Response, SR parameter in Electrical Characteristics: +5.5 V table	4
• Changed Output, V_O parameter in Electrical Characteristics: +5.5 V table	4
• Changed Output, I_{SC} parameter in Electrical Characteristics: +5.5 V table	4
• Changed test conditions for the first row in the Power Supply, I_Q parameter in Electrical Characteristics: +5.5 V table	4
• Changed Electrical Characteristics: +1.8 V table	5
• Changed conditions of Electrical Characteristics: +1.8 V table	5
• Changed last row of Input Voltage Range, $CMRR$ parameter in Electrical Characteristics: +1.8 V table	5
• Changed footnote to Input Bias Current, I_B and I_{OS} parameters in Electrical Characteristics: +1.8 V table	5
• Changed Open-Loop Gain, A_{OL} parameter in Electrical Characteristics: +1.8 V table	5
• Changed Frequency Response, GBW parameter test conditions in Electrical Characteristics: +1.8 V table	6
• Changed Frequency Response, SR parameter test conditions in Electrical Characteristics: +1.8 V table	6
• Changed Output, V_O parameter test conditions in Electrical Characteristics: +1.8 V table	6
• Changed Output, I_{SC} parameter in Electrical Characteristics: +1.8 V table	6
• Deleted last row from Power Supply, I_Q parameter in Electrical Characteristics: +1.8 V table	6
• Updated Figure 2	10

Changes from Original (September 2012) to Revision A	Page
• Changed from product preview to production data	1

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
