Undervoltage Control

Without memory ("No Memory" mode)

T_t Time delay after crossing of threshold (adjustable from 0.1 s to 10 s)

U_n Nominal supply voltage

U Monitored supply voltage

H Hysteresis adjusted by means of a potentiometer graduated from 5...20% of the threshold setting

$U<$ Undervoltage threshold (set by means of a graduated potentiometer)

11-12 Output relay connections (refer to Connections and Schema)

Relay status: black color = energized.

With memory ("Memory" mode)

$U<$ Undervoltage threshold (set by means of a graduated potentiometer)

11-12 Output relay connections (refer to Connections and Schema)

Relay status: black color = energized.

In "Memory" mode, the relay opens when crossing of the threshold is detected and then stays in that position. The power supply voltage must be switched off to reset the product.
