## Voltage Supervisor, Low Quiescent Current, Programmable Delay Time

The NCP308 series is one of the ON Semiconductor Supervisory circuit IC families. It is optimized to monitor system voltages from 0.405 V to 5.5 V, asserting an<u>active</u> low open-drain RESET output, together with Manual Reset (MR) Input. The part comes with both fixed and externally adjustable versions.

### Features

- Wide Supply Voltage Range 1.6 to 5.5 V
- Very Low Quiescent Current 1.6 µA
- Fixed Threshold Voltage Versions for Standard Voltage Rails Including 0.9 V, 1.2 V, 1.25 V, 1.5 V, 1.8 V, 1.9 V, 2.5 V, 2.8 V, 3.0 V, 3.3 V, 5.0 V
- Adjustable Version with Low Threshold Voltage 0.405 V (min)
- High Threshold Voltage Accuracy: 0.31% typ
- Support Manual Reset Input ( MR)
- Open-Drain RESET Output (Push-pull Output upon Request)
- Flexible Delay Time Programmability: 1.25 ms to 10 s
- Temperature Range: -40°C to +125°C
- Small TSOP-6 and WDFN6 2 x 2 mm, Pb-Free packages
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These are Pb-Free Devices

### **Typical Applications**

- DSP or Microcontroller Applications
- Notebook/Desktop Computers
- PDAs/Hand-Held Products
- Portable/Battery–Powered Products
- FPGA/ASIC Applications

### **ORDERING INFORMATION**

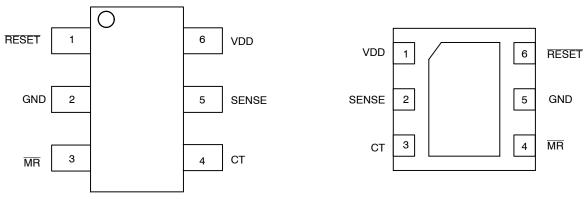

See detailed ordering and shipping information in the ordering information section on page 9 of this data sheet.

| Table 1. | PIN OUT DESCRIPTION |
|----------|---------------------|
|----------|---------------------|

|            | Pin Number |                |   |
|------------|------------|----------------|---|
| Name       | TSOP-6     | WDFN6          | Description   |
| VDD        | 6          | 1              | <b>Supply Voltage</b> . A 0.1uF ceramic capacitor placed close to this pin is helpful for transient and parasitic.  |
| SENSE      | 5          | 2              | <b>Sense Input</b> , this is the voltage to be monitored. If the voltage at this terminal drops below the threshold voltage $V_{IT}$ , then $\overrightarrow{RESET}$ is asserted. SENSE does not necessary monitor VDD, it can monitor any voltage lower than VDD.  |
| СТ         | 4          | 3              | <b>Reset Delay Time Setting Pin</b> . Connecting this pin to VDD through a 40 k $\Omega$ to 200 k $\Omega$ resistor or leaving it open results in fixed reset delay times. Connecting this pin to a ground referenced capacitor ( $\geq$ 100 pF) gives a user–programmable reset delay time. See the <i>Setting Reset Delay Time</i> section for more information.  |
| MR         | 3          | 4              | <b>Manual Reset input</b> , MR low asserts RESET. MR is internally tied to VDD by a 90 k $\Omega$ pull-up Resistor.   |
| RESET      | 1          | 6              | <b>RESET Output</b> , is an Active low open drain N–Channel MOSFET output, it is driven to a low impedance state when RESET is asserted (either the SENSE input is lower than the threshold voltage (V <sub>IT</sub> ) or the MR pin is set to a logic low). RESET will keep low (asserted) for the reset delay time after both SENSE is above V <sub>IT</sub> and MR is set to a logic high. A pull–up resistor from 10k $\Omega$ to 1M $\Omega$ should be used on this pin. See Figure 5 for behavior of RESET depends on VDD, SENSE and MR conditions. |
| GND        | 2          | 5              | Ground terminal. Should be connected to PCB ground reference  |
| EXP<br>PAD | -          | Exposed<br>Pad | Exposed pad, under WDFN6 package, connect it to ground plane for better thermal dissipation.  |

 NCP308XX: XX = MT (WDFN6 package) or SN (TSOP-6 package).

## **TYPICAL OPERATING CHARACTERISTICS**

### DETAILED DESCRIPTION

The NCP308 microprocessor supervisory product family is designed to assert a  $\overline{\text{RESET}}$  signal when either the SENSE pin voltage drops below V<sub>IT</sub> or the Manual Reset input ( $\overline{\text{MR}}$ ) is driven low. The  $\overline{\text{RESET}}$  output remains asserted for a programmable delay time after both  $\overline{\text{MR}}$  and SENSE voltages return above the respective thresholds. A broad range of voltage threshold and reset delay time options are available, allowing NCP308 series to be used in a wide range of applications.

Reset threshold voltages can be factory-set from 0.82 V to 3.3 V or from 4.4 V to 5.0 V, while the NCP308XXADJ can be used for any voltage above 0.405 V using an external resistor divider.

Flexible delay time can be easily got with CT pin according to Table 5:

| CT pin Configuration   | Delay Time (tD)   |
|--|---|
| CT = VDD   | 300 ms (fixed)  |
| CT = Open  | 20 ms (fixed)   |
| Connecting a capacitor be-<br>tween pin CT and GND<br>(Capacitor CT value ><br>100 pF) | 1.25 ms ~ 10 s, depends on<br>capacitor value (Refer to the<br>Setting Reset Delay Time<br>Section) |

#### Table 5. DELAY TIME SETTING TABLE

#### Output

The RESET output is typically connected to the RESET control pin of a microprocessor. For Open–Drain output versions, a pull–up resistor must be used to hold this line high when RESET is not asserted. The RESET output is active once  $V_{DD}$  is over  $V_{DD}$ (min), this voltage is much lower than most microprocessors' functional voltage range. RESET remains high as long as SENSE is above its threshold ( $V_{IT}$ ) and the Manual Reset input ( $\overline{MR}$ ) is logic high. If either SENSE falls below  $V_{IT}$  or  $\overline{MR}$  is driven low, RESET is asserted.

Once  $\overline{\text{MR}}$  is again logic high and SENSE is above (V<sub>IT</sub> + V<sub>HYS</sub>), the RESET pin goes to a high impedance state after delay time (tD). The open-drain structure of RESET is capable to allow the reset signal for the microprocessor to have a voltage higher than V<sub>DD</sub> (up to 5.5 V). The pull-up resistor should be no smaller than 10 k $\Omega$  as a result of the finite impedance of the RESET line.

#### SENSE Input

The SENSE input should be connected to the monitored voltage directly. If the voltage on this pin drops below  $V_{IT}$ , then  $\overline{RESET}$  is asserted. The comparator has a built-in hysteresis to prevent erratic reset operation. It is good practice to put a 1 nF to 10 nF bypass capacitor on the SENSE input to reduce its sensitivity to transients and layout parasitic.

The NCP308XXADJ can be used to monitor any voltage rail down to 0.405 V by the circuit shown in Figure 12. The new  $V_{IT}$ ' can be derived from resistor divider network of R1 and R2 by:

$$V_{\text{IT}}' = \left(\frac{\text{R1}}{\text{R2}} + 1\right) \times V_{\text{IT}}$$
 (eq. 1)

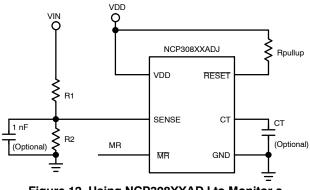

Figure 12. Using NCP308XXADJ to Monitor a User-Defined Threshold Voltage

#### Manual Reset Input (MR)

The Manual Reset input ( $\overline{\text{MR}}$ ) allows a processor or other logic circuits to initiate a reset. A logic low on  $\overline{\text{MR}}$  causes RESET to assert. After  $\overline{\text{MR}}$  returns to a logic high and SENSE is above its reset threshold, RESET is de-asserted after the delay time set by CT pin.  $\overline{\text{MR}}$  is internally tied to V<sub>DD</sub> by a 90 k $\Omega$  resistor so this pin can be left unconnected if  $\overline{\text{MR}}$  will not be used.

Figure 13 shows how  $\overline{\text{MR}}$  can be used to monitor multiple system voltages (e.g. I/O supply voltage of some DSP/processors should be setup before core voltage, and DSP/processor can only start after both I/O and core voltages setup).

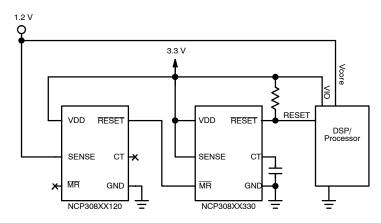

Figure 13. Using MR to Monitor Multiple System Voltages

### **Setting Reset Delay Time**

The NCP308 has three options for setting the reset delay time as shown in Table 5. Figure 14 shows the configuration for a fixed 300 ms typical delay time by tying CT to  $V_{DD}$ ; a resistor from 40 k $\Omega$  to 200 k $\Omega$  must be used. Figure 15 shows a fixed 20 ms delay time by leaving the CT pin unconnected.

Figure 16 shows a user-defined program time between 1.25 ms and 10 s by connecting a capacitor between CT pin and ground.

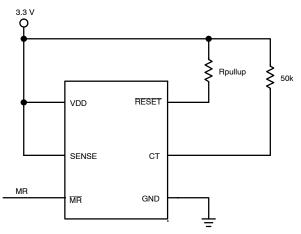

Figure 14. Delay Time Fixed to 300 ms when CT Connected to VDD by Resistor

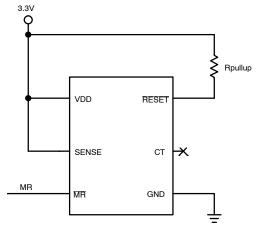

Figure 15. Delay Time Fixed to 20 ms when CT is Open

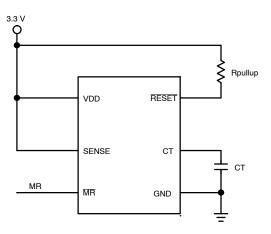

Figure 16. Delay Time Set by Capacitor

The capacitor CT should be  $\geq 100$  pF for NCP308 to recognize that the capacitor is present. The capacitor value for a given delay time can be calculated using the following equation:

 $CT(nF) = (tD(s) - 0.5 \times 10^{-3}(s)) \times 175$  (eq. 2)

Parasitic capacitances of CT pin should be considered to avoid reset delay time deviation or error.

### Immunity to Sense Pin Voltage Transients

NCP308 is relatively immune to short negative transients on SENSE pin. Sensitivity to transients is dependent on

## Duration at Sense vs. Sense Threshold Overdrive Voltage graph (Figure 9) in Typical Operating Characteristics section.

threshold overdrive, as shown in the Maximum Transient

| Device          | Status (Note 6) | Threshold<br>Voltage<br>(V <sub>IT</sub> ) | Nominal<br>Monitored<br>Voltage | Marking | Package   | Shipping <sup>†</sup> |  |  |  |
|-----------------|-----------------|--|---------------------------------|---------|-----------|-----------------------|--|--|--|

+ For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

\*NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable.

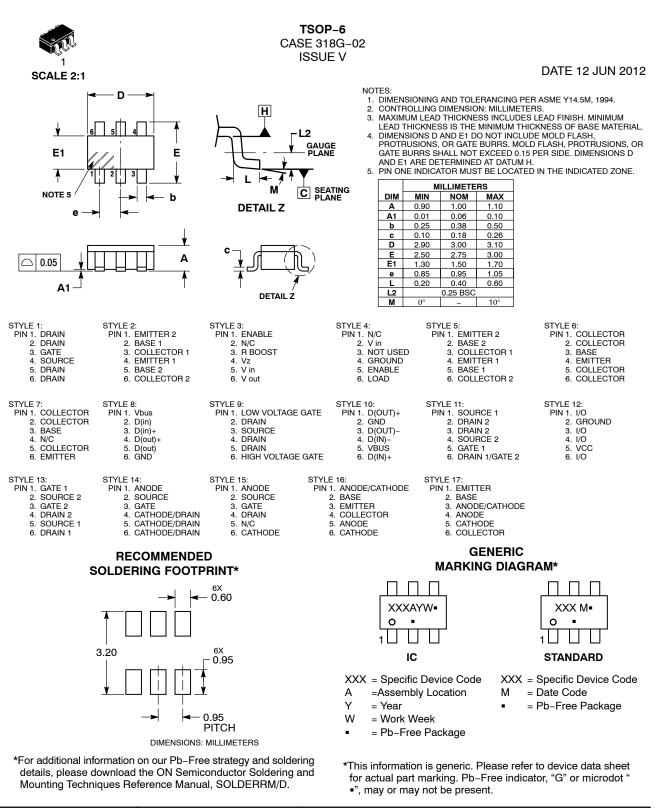

6. The marketing status are defined as below:

Active: Products in production and recommended for new designs;

Under Request: Device has been announced but is not in production. Samples may or may not be available.

 DESCRIPTION:
 WDFN6 2X2, 0.65P
 PAGE 1 OF 1

ON Semiconductor and ()) are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. ON Semiconductor does not convey any license under its patent rights or others.

ON Semiconductor and are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of ON Semiconductor's product/patent coverage may be accessed at <u>www.onsemi.com/site/pdf/Patent-Marking.pdf</u>. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor date sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use a a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor houteds for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries
