Notes: VDD and GND Pins Layout Guide

1. Small value decoupling caps. (0.1uF, 1uF, and 2.2uF) should be placed close each VDD pin or its via
2. Connect all GND pins to package thermal pad which must be connected to the GND plane for better thermal distribution and signal conducting with reasonable via count (>8)

#### Notes:

1. Measured at the end of an 8-inch trace with a 5pF load.
2. Measurement taken from a single-ended waveform.
3. Measurement taken from a differential waveform.
4. Measured from -150 mV to +150 mV on the differential waveform. The signal is monotonic through the measurement region for rise and fall time. The 300 mV measurement window is centered on the differential zero crossing.
5. Measured at crossing point where the instantaneous voltage value of the rising edge of 100M+ equals the falling edge 100M-.

**Notes (Continued)**

6. Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing.  
 Refers to all crossing points for this measurement.
7. Defines as the absolute minimum or maximum instantaneous period. This includes cycle-to-cycle jitter, relative PPM tolerance, and spread spectrum modulation.
8. Defined as the total variation of all crossing voltages of rising 100M+ and falling 100M-.
9. Refer to section 4.3.2.1 of the PCI Express Base Specification, Revision 1.1 for information regarding PPM considerations.
10. PPM refers to parts per million and is a DC absolute period accuracy specification. 1 PPM is 1/1,000,000th of 100 MHz exactly or 100 Hz. For 300 PPM there is an error budget of 100Hz/PPM \* 300 PPM = 30 kHz. The period is measured with a frequency counter with measurement window set at 100 ms or greater. With spread spectrum turned off the error is less than ±300 ppm. With spread spectrum turned on there is an additional +2500 PPM nominal shift in maximum period resulting from the -0.5% down spread.

## Application Notes

### Crystal circuit connection

The following diagram shows PI6C49021 crystal circuit connection with a parallel crystal. For the  $CL=18\text{pF}$  crystal, it is suggested to use  $C1=27\text{pF}$ ,  $C2=27\text{pF}$ .  $C1$  and  $C2$  can be adjusted to fine tune to the target ppm of crystal oscillator according to different board layouts.

### Crystal Oscillator Circuit

Final choose/trim  $C1=C2=2 * CL - (Cb + Cj)$  for the target +/-ppm  
 Example:  $C1=C2=2*(18\text{pF}) - (4\text{pF}+5\text{pF})=27\text{pF}$
