

Typical Applications

The HMC440QS16G(E) is ideal for:

- Satellite Communication Systems
- Point-to-Point Radios
- Military Applications
- Sonet Clock Generation

Features

- Ultra Low SSB Phase Noise Floor:
-153 dBc/Hz @ 10 kHz offset @ 100 MHz Reference Frequency.
- Programmable Divider (N = 2 - 32) Operating up to 2.8 GHz
- Open Collector Output Buffer Amplifiers for Interfacing w/ Op-Amp Based Loop Filter
- QSOP16G SMT Package: 29.4 mm²

Functional Diagram

General Description

The HMC440QS16G(E) is an Integer-n synthesizer that incorporates a 10 to 1300 MHz digital Phase-Frequency Detector with 10 to 2800 MHz 5-Bit Frequency Counter (continuous division from 2 to 32) in miniature 16 lead QSOP plastic packages. It is intended for use in low phase noise offset-synthesizer applications. The HMC440QS16G(E)'s combination of high frequency operation along with ultra low phase noise floor make possible synthesizers with wide loop bandwidth and low N resulting in fast settling and very low phase noise. When used in conjunction with a differential loop amplifier, the HMC440QS16G(E) generates an output voltage that can be used to phase lock a VCO to a reference oscillator.

Electrical Specifications, $T_A = +25^\circ\text{C}$, $V_{CC} = 5\text{V}$

| Parameter | Conditions | Min. | Typ. | Max. | Units |
|------------------------------|--|------|------|------|-------------|
| Maximum Ref. Input Frequency | Sine or Square Wave Input | 1300 | | | MHz |
| Minimum Ref. Input Frequency | Square Wave Input | | | 10 | MHz |
| Reference Input Power Range | 100 MHz Frequency | -10 | | +10 | dBm |
| Maximum VCO Input Frequency | Sine or Square Wave Input | 2800 | | | MHz |
| Minimum VCO Input Frequency | Square Wave Input | | | 10 | MHz |
| VCO Input Power Range | 100 MHz Input Frequency | -15 | | +10 | dBm |
| Output Voltage | 200 Ohm Pull Up to Vcc | | 2000 | | mV, Pk - Pk |
| SSB Phase Noise | @ 10 kHz Offset @ 100 MHz Ref. Input, Pin= 0 dBm | | -153 | | dBc/Hz |
| Supply Current | | | 250 | | mA |

**2.8 GHz INTEGER-N SYNTHESIZER
(N = 2 - 32)**

Error Voltage vs. Frequency, $P_{in} = 0$ dBm*

Error Voltage vs. Supply Voltage, $P_{in} = 0$ dBm, $F_{in} = 640$ MHz*

Error Voltage vs. Temperature, $P_{in} = 0$ dBm, $F_{in} = 640$ MHz*

SSB Phase Noise Performance, $P_{in} = 0$ dBm, $T = 25$ °C

SSB Phase Noise Performance, $P_{in} = 0$ dBm, $F_{in} = 100$ MHz

Evaluation PCB

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and backside ground slug should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.

List of Materials for

Evaluation PCB 105811 [1]

| Item | Description |
|---------------|------------------------------|
| J1 - J6 | PC Mount SMA RF Connector |
| J7 | 2 mm DC Header |
| C1-C4, C7, C8 | 100 pF Capacitor, 0402 Pkg. |
| C5, C6, C9 | 1000 pF Capacitor, 0603 Pkg. |
| C10 | 4.7 μ F Capacitor |
| R1, R3 | 200 Ohm Resistor, 0603 Pkg. |
| R2[3], R4 [3] | 4.3 Ohm Resistor, 0603 Pkg. |
| R5 | Resistor Network, 10k Ohm |
| U1 | HMC440QS16G / HMC440QS16GE |
| PCB [2] | 105738 Eval Board |

Applications Information

Simplified Block Diagram of 5-Bit Counter

Asynchronous Programming

The 5-Bit programmable counter counts-down from the programmed value of the data bits to zero and issues an output pulse at the end of each cycle. Settling time of the programmable 5-Bit counter is defined as the maximum time required for the counter to change the division ratio N to a new value after the data bits have settled. The worst case settling time occurs if the data bits A0 thru A4 are changing during the load cycle. Under this condition, the data bits may potentially be erroneous when they are clocked in and in the worst case could be all 1's, requiring 32 clock cycles until the correct data is re-loaded into the flip flops. The worst case asynchronous settling time can be calculated as follows:

$$T_{\text{SETTLING MAX}} = 32/f_{\text{IN}} \text{ (For Asynchronous Programming)}$$

As an example, if the input frequency is 1 GHz, the maximum settling time is 32 nS

Synchronous Programming

For applications which can not tolerate a momentary undefined division ratio, which normally occurs while changing the data bits (A0-A4) at random, synchronous programming can be used. Data is loaded into the counter on every rising edge of the clock which occurs while the output (OUT) is "HIGH". The typical minimum setup and hold times are shown in the table below as a function of frequency. For precision applications, the rising edge of the complementary output may be used to latch the new data bits (A0-A4), so that all bits are settled before the next load cycle.

$$T_{\text{SETTLING MAX}} = N/f_{\text{IN}} \text{ (For Synchronous Programming)}$$

Where N is the desired division ratio, and f_{IN} = Input Frequency (Hz)

| Parameter | 0.5 GHz | 1 GHz | 2 GHz |
|--------------------|---------|--------|--------|
| t_{SETUP} | 200 ps | 200 ps | 200 ps |
| t_{HOLD} | 700 ps | 300 ps | 120 ps |

**Programmable Divider Timing Requirements
for Synchronous Programming**

CMOS/TTL Input Characteristics

Maximum Input Logic "0" Voltage ($V_{IL\ MAXIMUM}$) = 1.1V @ 1 μ A.

Minimum Input Logic "1" Voltage ($V_{IH\ MINIMUM}$) = 1.8V @ 50 μ A.

Input IV characteristics for the logic inputs (A0-A4) are shown below:
