

Low Offset, Low Noise, RRO Operational Amplifier

Check for Samples: [SM73308](#)

FEATURES

(Unless Otherwise Noted, Typical Values at $V_S = 2.7V$)

- Renewable Energy Grade
- Ensured 2.7V and 5V Specifications
- Maximum V_{OS} 850 μV (Limit)
- Voltage noiseN
 - $f = 100$ Hz 12.5nV/ \sqrt{Hz}
 - $f = 10$ kHz 7.5nV/ \sqrt{Hz}
- Rail-to-Rail Output Swing
 - $R_L = 600\Omega$ 100mV From Rail
 - $R_L = 2k\Omega$ 50mV From Rail
- Open Loop Gain With $R_L = 2k\Omega$ 100dB
- V_{CM} 0 to $V^+ - 0.9V$
- Supply Current 550 μA
- Gain Bandwidth Product 3.5MHz
- Temperature Range $-40^\circ C$ to $125^\circ C$

APPLICATIONS

- Transducer Amplifier
- Instrumentation Amplifier
- Precision Current Sensing
- Data Acquisition Systems
- Active Filters and Buffers
- Sample and Hold
- Portable/battery Powered Electronics
- Automotive

Connection Diagram

See Package Number DCK

DESCRIPTION

The SM73308 is a single low noise precision operational amplifier intended for use in a wide range of applications. Other important characteristics include: an extended operating temperature range of $-40^\circ C$ to $125^\circ C$, the tiny SC70-5 package, and low input bias current.

The extended temperature range of $-40^\circ C$ to $125^\circ C$ allows the SM73308 to accommodate a broad range of applications. The SM73308 expands TI's Silicon Dust™ amplifier portfolio offering enhancements in size, speed, and power savings. The SM73308 is ensured to operate over the voltage range of 2.7V to 5.0V and has rail-to-rail output.

The SM73308 is designed for precision, low noise, low voltage, and miniature systems. This amplifier provides rail-to-rail output swing into heavy loads. The maximum input offset is 850 μV at room temperature and the input common mode voltage range includes ground.

The SM73308 is offered in the tiny SC70-5 package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Instrumentation Amplifier

$$V_O = -K(2a + 1)(V_1 - V_2) \quad (1)$$

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings⁽¹⁾⁽²⁾

ESD Tolerance ⁽³⁾	Machine Model	200V
	Human Body Model	2000V
Differential Input Voltage		± Supply Voltage
Voltage at Input Pins		(V ⁺) + 0.3V, (V ⁻) - 0.3V
Current at Input Pins		±10 mA
Supply Voltage (V ⁺ -V ⁻)		5.75V
Output Short Circuit to V ⁺		See ⁽⁴⁾
Output Short Circuit to V ⁻		See ⁽⁵⁾
Mounting Temperature	Infrared or Convection (20 sec)	235°C
	Wave Soldering Lead Temp (10 sec)	260°C
Storage Temperature Range		-65°C to 150°C
Junction Temperature ⁽⁶⁾		150°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (3) Human Body Model is 1.5 kΩ in series with 100 pF. Machine Model is 0Ω in series with 20 pF.
- (4) Shorting output to V⁺ will adversely affect reliability.
- (5) Shorting output to V⁻ will adversely affect reliability.
- (6) The maximum power dissipation is a function of T_{J(MAX)}, θ_{JA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / θ_{JA}. All numbers apply for packages soldered directly into a PC board.

Operating Ratings⁽¹⁾

Supply Voltage	2.7V to 5.5V
Temperature Range	-40°C to 125°C
Thermal Resistance (θ _{JA})	440 °C/W

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.

2.7V DC Electrical Characteristics⁽¹⁾

Unless otherwise specified, all limits are ensured for $T_A = 25^\circ\text{C}$. $V^+ = 2.7\text{V}$, $V^- = 0\text{V}$, $V_{\text{CM}} = V^+/2$, $V_O = V^+/2$ and $R_L > 1\text{M}\Omega$.

Boldface limits apply at the temperature extremes.

Symbol	Parameter	Condition	Min ⁽²⁾	Typ ⁽³⁾	Max ⁽²⁾	Units

APPLICATION NOTE

SM73308

The SM73308 is a precision amplifier with very low noise and ultra low offset voltage. SM73308's extended temperature range of -40°C to 125°C enables the user to design a variety of applications including automotive.

The SM73308 has a maximum offset voltage of 1mV over the extended temperature range. This makes the SM73308 ideal for applications where precision is important.

INSTRUMENTATION AMPLIFIER

Measurement of very small signals with an amplifier requires close attention to the input impedance of the amplifier, gain of the overall signal on the inputs, and the gain on each input since we are only interested in the difference of the two inputs and the common signal is considered noise. A classic solution is an instrumentation amplifier. Instrumentation amplifiers have a finite, accurate, and stable gain. Also they have extremely high input impedances and very low output impedances. Finally they have an extremely high CMRR so that the amplifier can only respond to the differential signal. A typical instrumentation amplifier is shown in [Figure 42](#).

Figure 42. Instrumentation Amplifier

There are two stages in this amplifier. The last stage, output stage, is a differential amplifier. In an ideal case the two amplifiers of the first stage, input stage, would be set up as buffers to isolate the inputs. However they cannot be connected as followers because of real amplifier's mismatch. That is why there is a balancing resistor between the two. The product of the two stages of gain will give the gain of the instrumentation amplifier. Ideally, the CMRR should be infinite. However the output stage has a small non-zero common mode gain which results from resistor mismatch.

In the input stage of the circuit, current is the same across all resistors. This is due to the high input impedance and low input bias current of the SM73308. With the node equations we have:

$$\text{GIVEN: } I_{R_1} = I_{R_{11}} \quad (2)$$

By Ohm's Law:

$$\begin{aligned} V_{01} - V_{02} &= (2R_1 + R_{11}) I_{R_{11}} \\ &= (2a + 1) R_{11} \cdot I_{R_{11}} \\ &= (2a + 1) V_{R_{11}} \end{aligned} \quad (3)$$

However:

$$V_{R_{11}} = V_1 - V_2 \quad (4)$$

So we have:

$$V_{O1} - V_{O2} = (2a + 1) (V_1 - V_2) \tag{5}$$

Now looking at the output of the instrumentation amplifier:

$$\begin{aligned} V_O &= \frac{KR_2}{R_2} (V_{O2} - V_{O1}) \\ &= -K (V_{O1} - V_{O2}) \end{aligned} \tag{6}$$

Substituting from [Equation 5](#):

$$V_O = -K (2a + 1) (V_1 - V_2) \tag{7}$$

This shows the gain of the instrumentation amplifier to be:

$$-K(2a+1) \tag{8}$$

Typical values for this circuit can be obtained by setting: a = 12 and K= 4. This results in an overall gain of -100.

[Figure 43](#) shows typical CMRR characteristics of this Instrumentation amplifier over frequency. Three SM73308 amplifiers are used along with 1% resistors to minimize resistor mismatch. Resistors used to build the circuit are: R₁ = 21.6kΩ, R₁₁ = 1.8kΩ, R₂ = 2.5kΩ with K = 40 and a = 12. This results in an overall gain of -1000, -K(2a+1) = -1000.

Figure 43. CMRR vs. Frequency

ACTIVE FILTER

Active filters are circuits with amplifiers, resistors, and capacitors. The use of amplifiers instead of inductors, which are used in passive filters, enhances the circuit performance while reducing the size and complexity of the filter.

The simplest active filters are designed using an inverting op amp configuration where at least one reactive element has been added to the configuration. This means that the op amp will provide "frequency-dependent" amplification, since reactive elements are frequency dependent devices.

LOW PASS FILTER

The following shows a very simple low pass filter.

Figure 44. Lowpass Filter

The transfer function can be expressed as follows:

By KCL:

$$\frac{-V_i}{R_1} - \frac{V_O}{\left[\frac{1}{j\omega C} \right]} - \frac{V_O}{R_2} = 0 \quad (9)$$

Simplifying this further results in:

$$V_O = \frac{-R_2}{R_1} \left[\frac{1}{j\omega C R_2 + 1} \right] V_i \quad (10)$$

or

$$\frac{V_O}{V_i} = \frac{-R_2}{R_1} \left[\frac{1}{j\omega C R_2 + 1} \right] \quad (11)$$

Now, substituting $\omega = 2\pi f$, so that the calculations are in f(Hz) and not ω (rad/s), and setting the DC gain $H_O = -R_2/R_1$ and $H = V_O/V_i$

$$H = H_O \left[\frac{1}{j2\pi f C R_2 + 1} \right] \quad (12)$$

Set: $f_o = 1/(2\pi R_1 C)$

$$H = H_O \left[\frac{1}{1 + j(f/f_o)} \right] \quad (13)$$

Low pass filters are known as lossy integrators because they only behave as an integrator at higher frequencies. Just by looking at the transfer function one can predict the general form of the bode plot. When the f/f_o ratio is small, the capacitor is in effect an open circuit and the amplifier behaves at a set DC gain. Starting at f_o , -3dB corner, the capacitor will have the dominant impedance and hence the circuit will behave as an integrator and the signal will be attenuated and eventually cut. The bode plot for this filter is shown in the following picture:

Figure 45. Lowpass Filter Transfer Function

HIGH PASS FILTER

In a similar approach, one can derive the transfer function of a high pass filter. A typical first order high pass filter is shown below:

Figure 46. Highpass Filter

Writing the KCL for this circuit :

(V_1 denotes the voltage between C and R_1)

$$\frac{V_1 - V_i}{\frac{1}{j\omega C}} = \frac{V_1 - V^-}{R_1} \quad (14)$$

$$\frac{V^- + V_1}{R_1} = \frac{V^- + V_O}{R_2} \quad (15)$$

Solving these two equations to find the transfer function and using:

$$f_0 = \frac{1}{2\pi R_1 C} \quad (16)$$

(high frequency gain) $H_0 = \frac{-R_2}{R_1}$ and $H = \frac{V_O}{V_i}$

Which results:

$$H = H_0 \frac{j(f/f_0)}{1 + j(f/f_0)} \quad (17)$$

Looking at the transfer function, it is clear that when f/f_0 is small, the capacitor is open and hence no signal is getting in to the amplifier. As the frequency increases the amplifier starts operating. At $f = f_0$ the capacitor behaves like a short circuit and the amplifier will have a constant, high frequency, gain of H_0 . Figure 47 shows the transfer function of this high pass filter:

Figure 47. Highpass Filter Transfer Function

BAND PASS FILTER

Figure 48. Bandpass Filter

Combining a low pass filter and a high pass filter will generate a band pass filter. In this network the input impedance forms the high pass filter while the feedback impedance forms the low pass filter. Choosing the corner frequencies so that $f_1 < f_2$, then all the frequencies in between, $f_1 \leq f \leq f_2$, will pass through the filter while frequencies below f_1 and above f_2 will be cut off.

The transfer function can be easily calculated using the same methodology as before.

$$H = H_0 \frac{j(f/f_1)}{[1 + j(f/f_1)] [1 + j(f/f_2)]}$$

where

$$f_1 = \frac{1}{2\pi R_1 C_1}$$

$$f_2 = \frac{1}{2\pi R_2 C_2}$$

$$H_0 = \frac{-R_2}{R_1}$$

(18)

The transfer function is presented in the following figure.

Figure 49. Bandpass filter Transfer Function

STATE VARIABLE ACTIVE FILTER

State variable active filters are circuits that can simultaneously represent high pass, band pass, and low pass filters. The state variable active filter uses three separate amplifiers to achieve this task. A typical state variable active filter is shown in Figure 50. The first amplifier in the circuit is connected as a gain stage. The second and third amplifiers are connected as integrators, which means they behave as low pass filters. The feedback path from the output of the third amplifier to the first amplifier enables this low frequency signal to be fed back with a finite and fairly low closed loop gain. This is while the high frequency signal on the input is still gained up by the open loop gain of the 1st amplifier. This makes the first amplifier a high pass filter. The high pass signal is then fed into a low pass filter. The outcome is a band pass signal, meaning the second amplifier is a band pass filter. This signal is then fed into the third amplifiers input and so, the third amplifier behaves as a simple low pass filter.

Figure 50. State Variable Active Filter

The transfer function of each filter needs to be calculated. The derivations will be more trivial if each stage of the filter is shown on its own.

The three components are:

For A_1 the relationship between input and output is:

$$V_{O1} = \frac{-R_4}{R_1} V_0 + \left[\frac{R_6}{R_5 + R_6} \right] \left[\frac{R_1 + R_4}{R_1} \right] V_{IN} + \left[\frac{R_5}{R_5 + R_6} \right] \left[\frac{R_1 + R_4}{R_1} \right] V_{O2} \quad (19)$$

This relationship depends on the output of all the filters. The input-output relationship for A_2 can be expressed as:

$$V_{O2} = \frac{-1}{s C_2 R_2} V_{O1} \quad (20)$$

And finally this relationship for A_3 is as follows:

$$V_0 = \frac{-1}{s C_3 R_3} V_{O2} \quad (21)$$

Re-arranging these equations, one can find the relationship between V_0 and V_{IN} (transfer function of the lowpass filter), V_{O1} and V_{IN} (transfer function of the highpass filter), and V_{O2} and V_{IN} (transfer function of the bandpass filter) These relationships are as follows:

Lowpass Filter

$$\frac{V_0}{V_{IN}} = \frac{\left[\frac{R_1 + R_4}{R_1} \right] \left[\frac{R_6}{R_5 + R_6} \right] \left[\frac{1}{C_2 C_3 R_2 R_3} \right]}{s^2 + s \left[\frac{1}{C_2 R_2} \right] \left[\frac{R_5}{R_5 + R_6} \right] \left[\frac{R_1 + R_4}{R_1} \right] + \left[\frac{1}{C_2 C_3 R_2 R_3} \right]} \quad (22)$$

Highpass Filter

$$\frac{V_{O1}}{V_{IN}} = \frac{s^2 \left[\frac{R_1 + R_4}{R_1} \right] \left[\frac{R_6}{R_5 + R_6} \right]}{s^2 + s \left[\frac{1}{C_2 R_2} \right] \left[\frac{R_5}{R_5 + R_6} \right] \left[\frac{R_1 + R_4}{R_1} \right] + \left[\frac{1}{C_2 C_3 R_2 R_3} \right]} \quad (23)$$

Bandpass Filter

$$\frac{V_{O2}}{V_{IN}} = \frac{s \left[\frac{1}{C_2 R_2} \right] \left[\frac{R_1 + R_4}{R_1} \right] \left[\frac{R_6}{R_5 + R_6} \right]}{s^2 + s \left[\frac{1}{C_2 R_2} \right] \left[\frac{R_5}{R_5 + R_6} \right] \left[\frac{R_1 + R_4}{R_1} \right] + \left[\frac{1}{C_2 C_3 R_2 R_3} \right]} \quad (24)$$

The center frequency and Quality Factor for all of these filters is the same. The values can be calculated in the following manner:

$$\omega_c = \sqrt{\frac{1}{C_2 C_3 R_2 R_3}}$$

and

$$Q = \sqrt{\frac{C_2 R_2}{C_3 R_3} \left[\frac{R_5 + R_6}{R_6} \right] \left[\frac{R_1}{R_1 + R_4} \right]} \quad (25)$$

A design example is shown here:

Designing a bandpass filter with center frequency of 10kHz and Quality Factor of 5.5

To do this, first consider the Quality Factor. It is best to pick convenient values for the capacitors. $C_2 = C_3 = 1000\text{pF}$. Also, choose $R_1 = R_4 = 30\text{k}\Omega$. Now values of R_5 and R_6 need to be calculated. With the chosen values for the capacitors and resistors, Q reduces to:

$$Q = \frac{11}{2} = \frac{1}{2} \left[\frac{R_5 + R_6}{R_6} \right] \quad (26)$$

or

$$R_5 = 10R_6 \quad R_6 = 1.5\text{k}\Omega \quad R_5 = 15\text{k}\Omega \quad (27)$$

Also, for $f = 10\text{kHz}$, the center frequency is $\omega_c = 2\pi f = 62.8\text{kHz}$.

Using the expressions above, the appropriate resistor values will be $R_2 = R_3 = 16\text{k}\Omega$.

The following graphs show the transfer function of each of the filters. The DC gain of this circuit is:

$$\text{DC GAIN} = \left[\frac{R_1 + R_4}{R_1} \right] \left[\frac{R_6}{R_5 + R_6} \right] = -14.8 \text{ dB} \quad (28)$$

REVISION HISTORY

Changes from Revision A (April 2013) to Revision B	Page
• Changed layout of National Data Sheet to TI format	19

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
SM73308MG/NOPB	ACTIVE	SC70	DCK	5	1000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 125	S08	Samples
SM73308MGE/NOPB	ACTIVE	SC70	DCK	5	250	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 125	S08	Samples
SM73308MGX/NOPB	ACTIVE	SC70	DCK	5	3000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 125	S08	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

DCK (R-PDSO-G5)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - D. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
