

Micropower, Latching Voltage Monitors in SOT23-5

General Description

The MAX834/MAX835 micropower voltage monitors contain a 1.204V precision bandgap reference, comparator, and latched output in a 5-pin SOT23 package. Using the latched output prevents deep discharge of batteries. The MAX834 has an open-drain, n-channel output driver, while the MAX835 has a push-pull output driver. Two external resistors set the trip-threshold voltage.

The MAX834/MAX835 feature a level-sensitive latch, eliminating the need to add hysteresis to prevent oscillations in battery-load-disconnect applications.

Applications

Precision Battery Monitors
Load Switching
Battery-Powered Systems
Threshold Detectors

Features

- ◆ Prevent Deep Discharge of Batteries
- ◆ Precision $\pm 1.25\%$ Voltage Threshold
- ◆ Latched Output (Once Low, Stays Low Until Cleared)
- ◆ SOT23-5 Package
- ◆ Low Cost
- ◆ +2.5V to +11V Wide Operating Voltage Range
- ◆ $< 2\mu\text{A}$ Typical Supply Current
- ◆ Open-Drain Output (MAX834)/Push-Pull Output (MAX835)

Ordering Information

PART	PIN-PACKAGE	TOP MARK
MAX834EUK-T	5 SOT23	AAAX
MAX835EUK-T	5 SOT23	AAAY

Note: All devices are specified over the -40°C to $+85^{\circ}\text{C}$ operating temperature range.

Devices are available in both leaded and lead-free packaging. Specify lead-free by changing "-T" with "+T" when ordering.

Typical Operating Circuit

Pin Configuration

Micropower, Latching Voltage Monitors in SOT23-5

ABSOLUTE MAXIMUM RATINGS

V_{CC} , $\overline{OUT}$ (MAX834), CLEAR to GND -0.3V to +12V
 IN, $\overline{OUT}$ (MAX835) to GND -0.3V to ($V_{CC} + 0.3V$)
 INPUT Current
 V_{CC} 20mA
 IN 10mA
 OUT Current -20mA
 V_{CC} Rate of Rise 100V/ μ s

Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)
 5-Pin SOT23 (derate 7.1mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$) 571mW
 Operating Temperature Range -40°C to $+85^\circ\text{C}$
 Storage Temperature Range -65°C to $+150^\circ\text{C}$
 Lead Temperature (soldering, 10s) $+300^\circ\text{C}$
 Soldering Temperature (reflow) $+240^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

($V_{CC} = +2.5V$ to $+11V$, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$.)

PARAMETER	SYMBOL	CONDITIONS			MIN	TYP	MAX	UNITS
Operating Voltage Range (Note 1)	V _{CC}				2.5		11.0	V
Supply Current (Note 2)	I _{CC}	V _{IN} = 1.6V, $\overline{\text{OUT}}$ = low, V _{CLEAR} ≥ V _{CC} - 0.25V or V _{CLEAR} ≤ 0.25V	V _{CC} = 3.6V	T _A = +25°C	2.4	5	μA	
				T _A = T _{MIN} to T _{MAX}	10			
			V _{CC} = full operating range			15		
		V _{IN} = 1.25V, $\overline{\text{OUT}}$ = high, V _{CLEAR} ≥ V _{CC} - 0.25V or V _{CLEAR} ≤ 0.25V	V _{CC} = 3.6V	T _A = +25°C	1.1	4		
				T _A = T _{MIN} to T _{MAX}	8			
			V _{CC} = full operating range			13

ELECTRICAL CHARACTERISTICS (continued)

($V_{CC} = +2.5V$ to $+11V$, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $T_A = +25^\circ C$.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
CLEAR Input Low Voltage	V_{CIL}				0.4	V
CLEAR Input Leakage Current	I_{CLEAR}			± 1	± 100	nA
CLEAR Input Pulse Width	t_{CLR}		1			μs

Note 1: The voltage-detector output remains in the correct state for V_{CC} down to 1.2V when $V_{IN} \leq V_{CC}/2$.

Note 2: Supply current has a monotonic dependence on V_{CC} (see the *Typical Operating Characteristics*).

Note 3: IN leakage current has a monotonic dependence on V_{CC} (see the *Typical Operating Characteristics*).

Note 4: The MAX834 open-drain output can be pulled up to a voltage greater than V_{CC} , but may not exceed 11V.

Pin Description

PIN	NAME	FUNCTION
1	CLEAR	Clear Input Resets the Latched Output. With $V_{IN} > V_{TH}$, pulse CLEAR high for a minimum of $1\mu s$ to reset the output latch. Connect to V_{CC} to make the latch transparent.
2	GND	System Ground
3	V_{CC}	System Supply Input
4	IN	Noninverting Input to the Comparator. The inverting input connects to the internal 1.204V bandgap reference.
5	$\overline{OUT}$	Open-Drain (MAX834) or Push-Pull (MAX835) Latched Output. $\overline{OUT}$ is active-low.

Micropower, Latching Voltage Monitors in SOT23-5

Detailed Description

The MAX834/MAX835 micropower voltage monitors contain a 1.204V precision bandgap reference and a comparator with an output latch (Figure 1). The difference between the two parts is the structure of the comparator output driver. The MAX834 has an open-drain, n-channel output driver that can be pulled up to a voltage higher than VCC, but less than 11V. The MAX835's output is push-pull and can both source and sink current.

Programming the Trip Voltage (VTRIP)

Two external resistors set the trip voltage, VTRIP (Figure 2). VTRIP is the point at which the falling monitored voltage (typically VCC) causes $\overline{\text{OUT}}$ to go low. IN's high input impedance allows the use of large-value resistors without compromising trip voltage accuracy. To minimize current consumption, choose a value for R2 between 500k Ω and 1M Ω , then calculate R1 as follows:

$$R1 = R2 [(V_{\text{TRIP}} / V_{\text{TH}}) - 1]$$

where VTRIP is the desired trip voltage and VTH is the threshold voltage (1.204V). The voltage at IN must be at least 1V less than VCC.

Latched-Output Operation

The MAX834/MAX835 feature a level-sensitive latch input (CLEAR), designed to eliminate the need for hysteresis in battery undervoltage-detection applications. When the monitored voltage (VMON) is above the programmed trip voltage (VTRIP) (as when the system battery is recharged or a fresh battery is installed), pulse CLEAR low-high-low for at least 1 μ s to reset the output latch ($\overline{\text{OUT}}$ goes high). When VMON falls below VTRIP, $\overline{\text{OUT}}$ goes low and remains low (even if VMON rises above VTRIP), until CLEAR is pulsed high again with VMON > VTRIP. Figure 3a shows the timing relationship between VMON, $\overline{\text{OUT}}$, and CLEAR.

Figure 3a. Timing Diagram

Figure 3b. Timing Diagram, CLEAR = VCC

Figure 4. Monitoring Voltages Other than VCC

Monitoring Voltages Other than VCC

The *Typical Operating Circuit* for the MAX834/MAX835 monitors VCC. Voltages other than VCC can easily be monitored, as shown in Figure 4. Calculate V_{TRIP} as in the *Programming the Trip Voltage (V_{TRIP})* section. When monitoring voltages other than VCC, ensure that the maximum value for V_{MON} is not exceeded:

$$V_{MON(MAX)} = (V_{CC} - 1) (R1 + R2) / R2$$

Load-Disconnect Switch

The circuit in Figure 5 is designed to prevent a lead-acid battery or a secondary battery such as an NiCd, from sustaining damage through deep discharge. As the battery reaches critical undervoltage, $\overline{OUT}$ switches low. Q1 and Q2 turn off, disconnecting the battery from the load. The MAX835's latched output prevents Q1 and Q2 from turning on again as the battery voltage relaxes to its open-circuit voltage when the load disconnects. CLEAR can be connected to a pushbutton switch, an RC network, or a logic gate to reset the latch when the battery is recharged or replaced.
