Pneumatic logic components
Operating fluid
- Compressed air or inert gas.

Conditions of use
- Operating pressure 2 at 8 bars (except for special conditions).
- Fluid: Filtered air to 50 microns - non lubricated.
- Operating temperature from - 5° C to + 50° C (under + 5° C the dew point must be below 10° C for the application).
- For optimum performance, the elements should be inter-connected by air supply tubing with an internal diameter ≥ at 2.5 mm.

Mounting recommendations
- The elements should be mounted and piped in a clean atmosphere in order to prevent any form of pollution entering the system.
- Minimum torque for element fixing screws: 5 cm/kg.
- maximum torque for element fixing screws: 10 cm/kg.

Characteristics common to all elements in the modular system
- The characteristics have been obtained with a supply pressure at 6 bars.
- The flow in Nl/min is the number of litres of air at normal atmospheric pressure obtained with the output open to atmophere and the supply pressure at 4 bars
- The consumption in Nl/min is the number of litres of free air necessary for the unit to function.
- kV = the flow coefficient of the equipment.
- Mechanical life > 10^7 operations.

flow graphs
Sequencer modules

Operation results from the combination of a sequential cycle. A system comprises individual modules which are joined together by means of a sub-base. Each module has a memory which delivers an output signal and receives an input signal.

An indicator on each module allows the operator to monitor the progress of the cycle and identity quickly and easily any fault which may occur.
Operation results from the combination of three functions (memory, AND and OR) which constitute each module.
The memory activates the output and gives priority to the reset signal.
The AND element ensures the transition to the next module but only if an input signal is present.
The OR element ensures the resetting of all previously operated modules

Function diagram
sequencer module with maintained reset

Brake
This maintains the memory spool in position only when the supply is lost.
Module with auto reset

Brake
This returns the memory spool to the reset condition only when the supply is lost

Shift register
The general principle is to advance the sequencer step by command impulses to the inputs of the even steps, alternating with the command impulses to the inputs of the odd steps.
Used for example on a transfer machine to shift the information "bad component" collected at a test-test "n" steps further along the machine to a reject station.

Pilot/pressure curves

P.p : Pilot pressure
P.a : Supply pressure

Principle of operation
**Cellule OR**

The output signal "S" is present when a signal at "a" OR "b" is present:

S = a OR b   S = a + b

Cellule AND

The output signal "S" is present only when signals "a" AND "b" are present simultaneously:
S = a AND b   S = a . b

Dimensions
81 521 508 - 81 522 505

13	25	30	30	30	30
YES element

The output signal "S" is only present when the pilot is present "a" is present:

S = a YES b   S = a
NOT element

The output signal "s" is present only if the input signal "a" is NOT present. The output signal is therefore the inverse of the pilot signal:

S= NOT a $S = \overline{a}$
If the supply port is connected to a 2nd input "b", the function obtained is called inhibition:

S = NOT a AND b $S = \overline{a} . b$

⟨Ex⟩ Memory element

Equipment intended for use in potentially explosive atmospheres conforming to Directive 94/9/EC

| Version	81 523 205	81 523 608
	With pressure indicator	With pressure indicator and manual override
Classification	CE ⟨Ex⟩ II 2 G D c IIB 55°C(T6) X	

Symbol
Characteristics

Colour		Black	Black
Operating pressure	bar	2 → 8	2 → 8
Orifice diameter	mm	2.7	2.7
Minimum memory pilot pressure	bar	2.5	2.5
Operating temperature	°C	-5 +50	-5 +50
Flow at 6 bars	Nl/min	200	200
Connection - On sub-base page 36-37		●	●
Weight	g	90	90

Principle of operation

The function is that of a 4/2 valves. The appearence of signal "X1" causes the displacement of the slide valve. The output port "x" is then put under pressure. This state is remembered until the arrival of signal "X0". This signal reverses the slide valve, the output "x" is put under pressure. This state is likewise remembered. The output:

- "x" under pressure indicates that the information in the MEMORY is "X1",

- "x" under pressure indicates that the information in the MEMORY is "X0".

Weight	g	53	53	53	—	—	—

Principle

The operation of these pneumatic timers is similar to that of electronic timers (circuit with capacitor/resistor)

Timing by charging of reservoir

The reservoir fills via the flow restrictor until the switching point of the timer output is reached (positive or negative).
The non-return valve allows the reservoir to be emptied rapidly for the next timing.

Principle of operation

with positive output

with negative output

Classification					CE ⟨Ex⟩ II 2 G D c IIB T6 X
Characteristics					
Weight (g)	8	4	80	40	80
	For mounting on the end of a zinc-coated mild steel rod Ø 8 mm on an asymmetrical DIN rail	For adjustable mounting on a zinc-coated mild steel rod Ø 8 mm on an asymmetrical DIN rail	Packet of 100 pieces	Packet of 100 pieces	
Operating temperature °C	-5 +50	-5 +50	-5 +50	-5 +50	-5 +50

Dimensions
81 536 804

- 13 outputs push-in fittings 4 mm Ø
- Input port 8 mm Ø push-in fitting
- 80
- 35
- Mounted on steel rod Ø 8 mm
- 67
- 25
- Push-in connection for semi-rigid tubing Ø 4 mm (NFE 49100)
Other information
Use Weidmuller plastic labels for marking components part number FW 4734-6.
