

EIGHT OUTPUT DIFFERENTIAL BUFFER FOR PCIE GEN1 AND GEN2

ICS9DB803D

General Description

The ICS9DB803D is compatible with the Intel DB800v2 Differential Buffer Specification. This buffer provides 8 PCI-Express Gen2 clocks. The ICS9DB803D is driven by a differential output pair from a CK410B+, CK505 or CK509B main clock generator.

Recommended Application

DB800v2 compatible part with PCle Gen1 and Gen2 Support

Output Features

- 8 0.7V current-mode differential output pairs
- Supports zero delay buffer mode and fanout mode
- Bandwidth programming available
- 50-100 MHz operation in PLL mode
- 50-400 MHz operation in Bypass mode

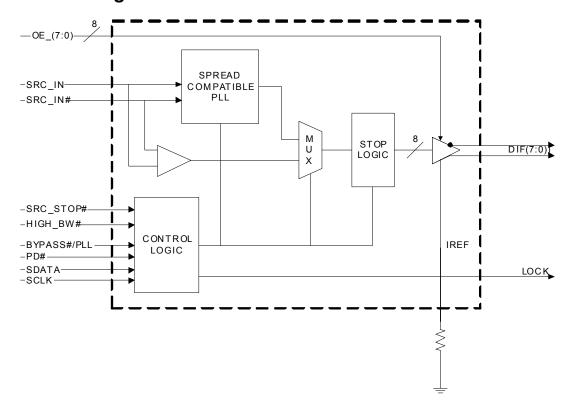

Features/Benefits

- Spread spectrum modulation tolerant, 0 to -0.5% down spread and +/- 0.25% center spread
- Supports undriven differential outputs in PD# and SRC_STOP# modes for power management

Key Specifications

- Outputs cycle-cycle jitter < 50ps
- Output to Output skew <50ps
- Phase jitter: PCIe Gen1 < 86ps peak to peak
- Phase jitter: PCle Gen2 < 3.0/3.1ps rms

Functional Block Diagram

Note: Polarities shown are for OE INV=0.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS9DB803D. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Symbol	Parameter	Min	Max	Units
VDDA/R	3.3V Core Supply Voltage		4.6	V
VDD	3.3V Logic Supply Voltage		4.6	V

Bit 0	•		BC0		RW	-	-	1

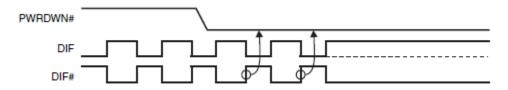

Note: Polarities in timing diagrams are shown OE INV = 0. They are similar to OE INV = 1.

PD#, Power Down

The PD# pin cleanly shuts off all clocks and places the device into a power saving mode. PD# must be asserted before shutting off the input clock or power to insure an orderly shutdown. PD is asynchronous active-low input for both powering down the device and powering up the device. When PD# is asserted, all clocks will be driven high, or tri-stated (depending on the PD# drive mode and Output control bits) before the PLL is shut down.

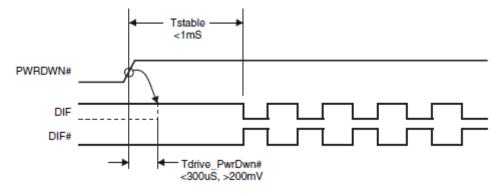

PD# Assertion

When PD# is sampled low by two consecutive rising edges of DIF#, all DIF outputs must be held High, or tri-stated (depending on the PD# drive mode and Output control bits) on the next High-Low transition of the DIF# outputs. When the PD# drive mode bit is set to '0', all clock outputs will be held with DIF driven High with 2 x IREF and DIF# tri-stated. If the PD# drive mode bit is set to '1', both DIF and DIF# are tri-stated.

PD# De-assertion

Power-up latency is less than 1 ms. This is the time from de-assertion of the PD# pin, or VDD reaching 3.3V, or the time from valid SRC_IN clocks until the time that stable clocks are output from the device (PLL Locked). If the PD# drive mode bit is set to '1', all the DIF outputs must driven to a voltage of >200 mV within 300 us of PD# de-assertion.

SRC STOP#

The SRC_STOP# signal is an active-low asynchronous input that cleanly stops and starts the DIF outputs. A valid clock must be present on SRC_IN for this input to work properly. The SRC_STOP# signal is de-bounced and must remain stable for two consecutive rising edges of DIF# to be recognized as a valid assertion or de-assertion.

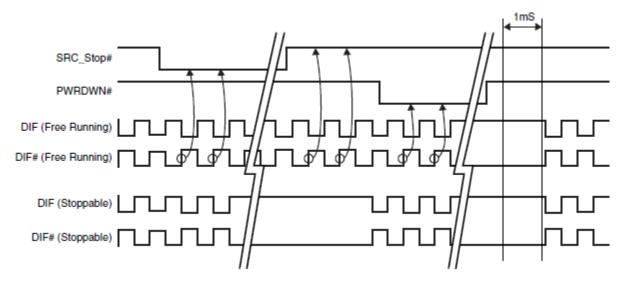

SRC STOP# - Assertion

Asserting SRC_STOP# causes all DIF outputs to stop after their next transition (if the control register settings allow the output to stop). When the SRC_STOP# drive bit is '0', the final state of all stopped DIF outputs is DIF = High and DIF# = Low. There is no change in output drive current. DIF is driven with 6xIREF. DIF# is not driven, but pulled low by the termination. When the SRC_STOP# drive bit is '1', the final state of all DIF output pins is Low. Both DIF and DIF# are not driven.

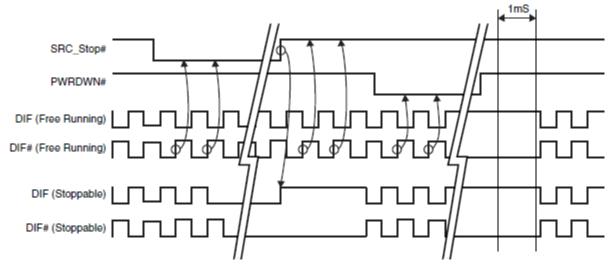

SRC_STOP# - De-assertion (transition from '0' to '1')

All stopped differential outputs resume normal operation in a glitch-free manner. The de-assertion latency to active outputs is 2-6 DIF clock periods, with all DIF outputs resuming simultaneously. If the SRC_STOP# drive control bit is '1' (tri-state), all stopped DIF outputs must be driven High (>200 mV) within 10 ns of de-assertion.

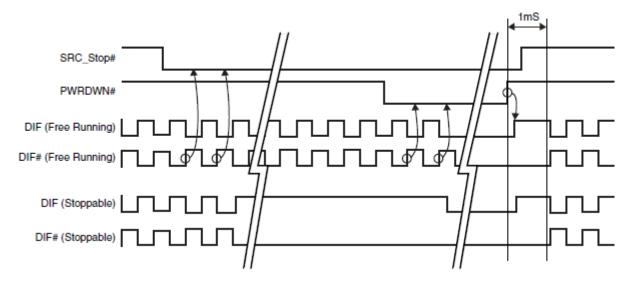

SRC_STOP_1 (SRC_Stop = Driven, PD = Driven)

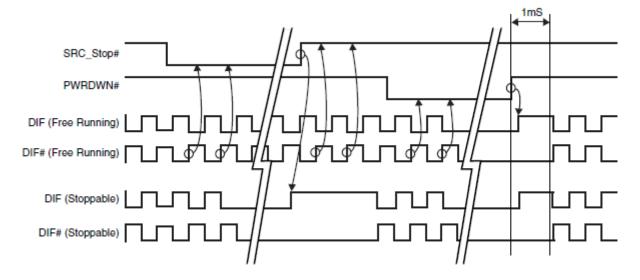

SRC STOP 2 (SRC Stop =Tristate, PD = Driven)

SRC_STOP_3 (SRC_Stop = Driven, PD = Tristate)

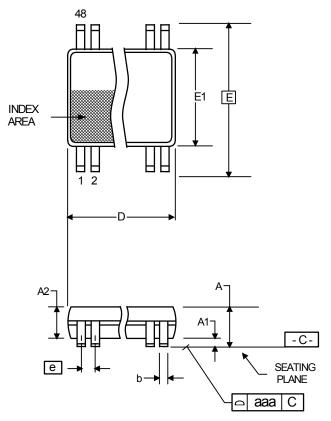

SRC_STOP_4 (SRC_Stop = Tristate, PD = Tristate)

Revision History

Rev.	Issue Date	Issuer	Description	Page #
Α	8/15/2006		Updated electrical characteristics for final data sheet	-
В			Added Input Clock Specs	
С	2/29/2008		Updated Input Clock Specs	
D	3/18/2008		Fixed typo in Input Clock Parameters	
Е	3/28/2008		Updated Electrical Char tables	
F	4/10/2008		Updated Input Clock Specs	
G	1/13/2009		Corrected part ordering information	
			1. Clarified that Vih and Vil values were for Single ended inputs	
			2. Added Differential Clock input parameters.	
			3. Updated Electrical Characteristics to add propagation delay and	
			phase noise information.	
			4. Added SMBus electrical characteristics	
			5. Added foot note about DIF input running in order for the SMBus	
			interface to work	
			6. Added foot note to Byte 1 about functionality of OE bits and OE	
			pins.	
Н	10/7/2009		7. Updated/Reformatted General Description	Various
J	1/27/2011		Updated Termination Figure 4	12
			1. Update pin 2 pin-name and pin description from VDD to VDDR. This	
			highlights that optimal performance is obtained by treating VDDR as in	
К	5/9/2011		analog pin. This is a document update only, there is no silicon change.	Various
L	8/27/2012		Updated Vswing conditions to include "single-ended measurement"	7
			Updated Byte 2, bits 0~7 per char review. Outputs can be programmed	
М	9/18/2012		with Byte 2 to be Stoppable or Free-Run with DIF_Stop pin, not the OE	14
	3, 13, 23 .2		pins.	
			Typo discovered on front page "Output Features" section. Was: "50 –	
N	7/10/2013	R. Wei	110MHz operation in PLL mode"; changed to: "50 – 100MHz operation	1
			in PLL mode"	ļ
