Noise margin at the High level	V _{nH}	1	-	-	V

C_b ; total capacitance of one bus line in pF.NOTE). Data hold time : t_{HD:DAT}Please hold the Data Hold Time (t_{HD:DAT}) to 300ns or more to avoid status of unstable at SCL falling edge.

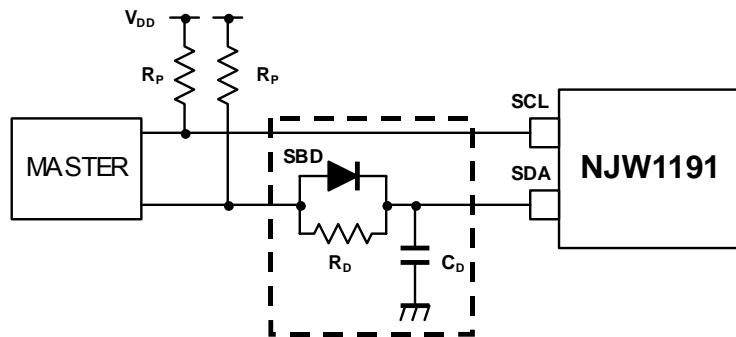

The SDA block in the NJW1191 does not hold data. Add external data-delay-circuit of the SDA terminal, in case of not providing a hold time of at least 300nsec for the SDA in the master device.

The time-consists of the data-delay-circuit of the SDA terminal are as follows.

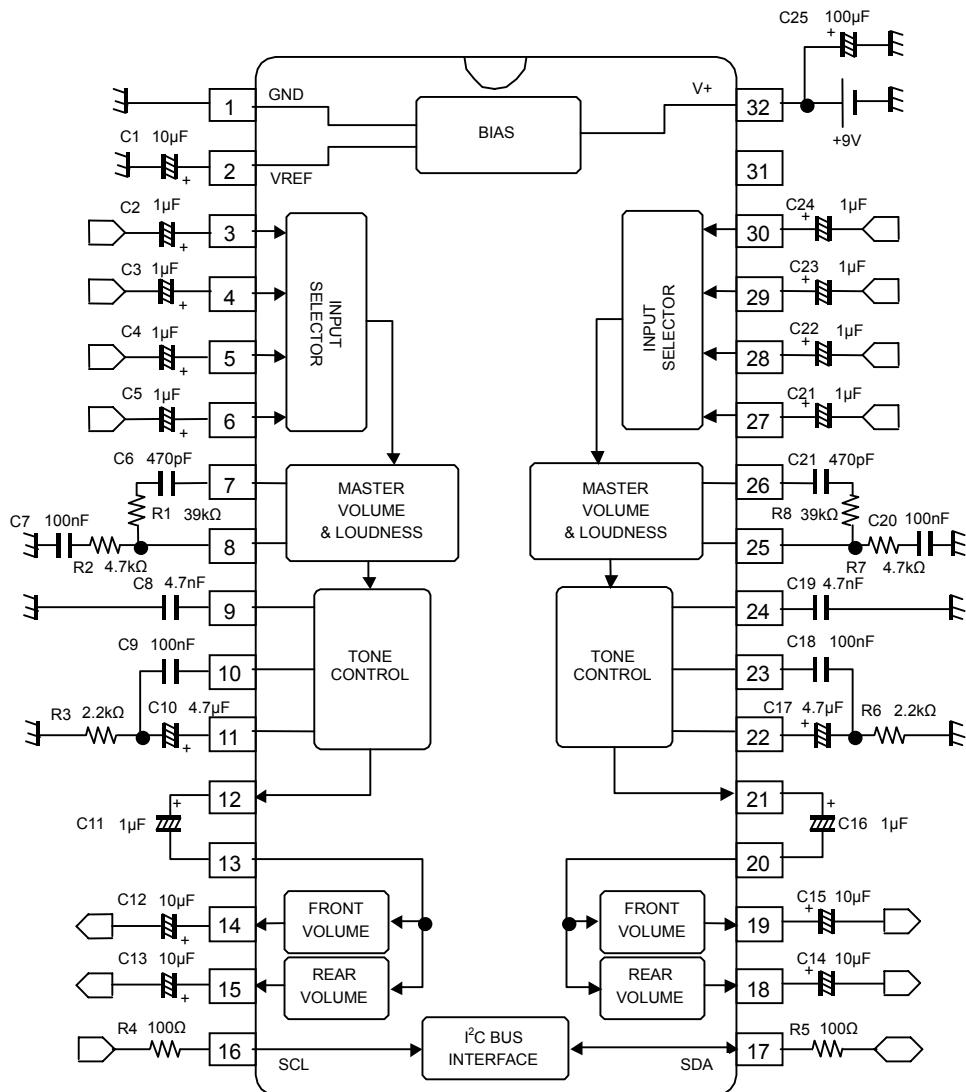

- (a) Low level → High level :
(b) High level → Low level :

$$\begin{aligned} T_{LH} &\approx R_P \cdot C_D \\ T_{HL} &\approx R_D \cdot C_D \end{aligned}$$

In addition, Schottky barrier diode (SBD) influences a Low level at the Acknowledge. Therefore choose the low forward voltage (Vf) as much as possible.

■APPLICATION NOTES

Pin No.	Function	Note
2	VREF	C1 can be adjusted rise and fall time of reference voltage at power on and off. Take care that the reduced C1 makes sensitive to ripple of power supply.
3 - 6, 27 - 30	Inputs	The Input impedance is designed about 48k ohms. The ground line should be inserted between each input lines to avoid cross talk.
7,8,25,26	Loudness filter Taps	Loudness frequency can be adjusted with external parts(See page 6) . Especially, 8 and 25 pins should be kept from large signal lines such as digital signal lines or the other sound signal lines to avoid digitally noise or cross talk in Loudness mode.
9,10,11,22,23, 24	Tone filter terminals	Tone Bass and Treble cut off frequency can be adjusted with external parts(See page6). These pins should be kept from large signal lines such as digital signal lines or the other sound signal lines to avoid the digitally noise or cross talk.
12,21	Tone outputs	Output impedance is designed about 50 ohms.
13,20	Balance Fedar volume inputs	Input impedance is designed about 24k ohms.
14,15,18,19	Balance Fedar volume outputs	Output impedance is designed about 50 ohms.
16,17	I ² C control signal ports	These terminals should be inserted resistance about 100 ohms between terminal and signal source to reduce the digitally noise. These lines should be kept from analog signal lines and or near by the chip to avoid digitally noise. Inserted ground line between analog line and digital line should be recommended.
