

# MCP6541/2/3/4

## **Push-Pull Output Sub-Microamp Comparators**

### Features

- Low Quiescent Current: 600 nA/comparator (typ.)
- Rail-to-Rail Input: V<sub>SS</sub> 0.3V to V<sub>DD</sub> + 0.3V
- CMOS/TTL-Compatible Output
- Propagation Delay 4 µs (typ.)
- Wide Supply Voltage Range: 1.6V to 5.5V
- Available in Single, Dual and Quad
- · Single available in SOT-23-5, SC-70-5 packages
- Chip Select (CS) with MCP6543
- · Low Switching Current
- Internal Hysteresis: 3.3 mV (typ.)
- Industrial Temperature: -40°C to +85°C

## **Typical Applications**

- · Laptop Computers
- Mobile Phones
- · Metering Systems
- · Hand-held Electronics
- RC Timers
- Alarm and Monitoring Circuits
- Windowed Comparators
- Multi-vibrators

## **Related Devices**

• Open-Drain Output: MCP6546/7/8/9

## Description

The Microchip Technology Inc. MCP6541/2/3/4 family of comparators is offered in single (MCP6541), single with chip select (MCP6543), dual (MCP6542) and quad (MCP6544) configurations. The outputs are push-pull (CMOS/TTL-compatible) and are capable of driving heavy DC or capacitive loads.

These comparators are optimized for low power, singlesupply operation with greater than rail-to-rail input operation. The push-pull output of the MCP6541/2/3/4 family supports rail-to-rail output swing and interfaces with TTL/CMOS logic. The internal input hysteresis eliminates output switching due to internal input noise voltage, reducing current draw. The output limits supply current surges and dynamic power consumption while switching. This product family operates with a singlesupply voltage as low as 1.6V and draws less than 1  $\mu$ A/ comparator of quiescent current.

The related MCP6546/7/8/9 family of comparators from Microchip has an open-drain output. Used with a pull-up resistor, these devices can be used as level-shifters for any desired voltage up to 10V and in wired-OR logic.

## 1.0 ELECTRICAL CHARACTERISTICS

### 1.1 Absolute Maximum Ratings †

V <sub>DD</sub> - V <sub>SS</sub>	7.0V
All inputs and outputs	. V <sub>SS</sub> –0.3V to V <sub>DD</sub> +0.3V
Difference Input voltage	V <sub>DD</sub> - V <sub>SS</sub>
Output Short-Circuit Current	continuous
Current at Input Pins	±2 mA
Current at Output and Supply Pins	±30 mA
Storage temperature	65°C to +150°C
Maximum Junction Temperature ( $T_J$	)+150°C
ESD protection on all pins (HBM;MM	M)4 kV; 400V

**†** Notice: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

## **PIN FUNCTION TABLE**

NAME	FUNCTION
V <sub>IN</sub> +, V <sub>INA</sub> +, V <sub>INB</sub> +, V <sub>INC</sub> +, V <sub>IND</sub> +	Non-Inverting Inputs
$V_{IN}$ -, $V_{INA}$ -, $V_{INB}$ -, $V_{INC}$ -, $V_{IND}$ -	Inverting Inputs

## 3.0 APPLICATIONS INFORMATION

The MCP6541/2/3/4 family of push-pull output comparators are fabricated on Microchip's state-of-the-art CMOS process. They are suitable for a wide range of applications requiring very low power consumption.

### 3.1 Comparator Inputs

The MCP6541/2/3/4 comparator family uses CMOS transistors at the input. They are designed to prevent phase inversion when the input pins exceed the supply voltages. Figure 2-31 shows an input voltage exceeding both supplies with no resulting phase inversion.

The input stage of this family of devices uses two differential input stages in parallel: one operates at low input voltages and the other at high input voltages. With this topology, the input voltage is 0.3V above V<sub>DD</sub> and 0.3V below V<sub>SS</sub>. Therefore, the input offset voltage is measured at both V<sub>SS</sub> - 0.3V and V<sub>DD</sub> + 0.3V to ensure proper operation.

The maximum operating input voltages that can be applied are  $V_{SS}$  - 0.3V and  $V_{DD}$  + 0.3V. Voltages on the inputs that exceed this absolute maximum rating can cause excessive current to flow and permanently damage the device. In applications where the input pin exceeds the specified range, external resistors can be used to limit the current below ±2 mA, as shown in Figure 3-1.

**FIGURE 3-1:** An input resistor  $(R_{IN})$  should be used to limit excessive input current if either of the inputs exceeds the Absolute Maximum specification.

## 3.2 Push-Pull Output

The push-pull output is designed to be compatible with CMOS and TTL logic, while the output transistors are configured to give rail-to-rail output performance. They are driven with circuitry that minimizes any switching current (shoot-through current from supply-to-supply) when the output is transitioned from high-to-low, or from low-to-high (see Figures 2-15, 2-17, 2-32 through 2-36 for more information).

## 3.3 MCP6543 Chip Select (CS)

The MCP6543 is a single comparator with chip select  $(\overline{CS})$ . When  $\overline{CS}$  is pulled high, the total current consumption drops to 20 pA (typ); 1 pA (typ) flows through the  $\overline{CS}$  pin, 1 pA (typ) flows through the output pin and 18 pA (typ) flows through the V<sub>DD</sub> pin, as shown in Figure 1-1. When this happens, the comparator output is put into a high-impedance state. By pulling  $\overline{CS}$  low, the comparator is enabled. If the  $\overline{CS}$  pin is left floating, the comparator will not operate properly. Figure 1-1 shows the output voltage and supply current response to a  $\overline{CS}$  pulse.

The internal  $\overline{CS}$  circuitry is designed to minimize glitches when cycling the  $\overline{CS}$  pin. This helps conserve power, which is especially important in battery-powered applications.

## 3.4 Externally-Set Hysteresis

Greater flexibility in selecting hysteresis (or input trip points) is achieved by using external resistors.

Input offset voltage (V<sub>OS</sub>) is the center (average) of the (input-referred) low-high and high-low trip points. Input hysteresis voltage (V<sub>HYST</sub>) is the difference between the same trip points. Hysteresis reduces output chattering when one input is slowly moving past the other and thus reduces dynamic supply current. It also helps in systems where it is best not to cycle between states too frequently (e.g., air conditioner thermostatic control). The MCP6541/2/3/4 family has internally-set hysteresis that is small enough to maintain input offset accuracy (<7 mV) and large enough to eliminate output chattering caused by the comparator's own input noise voltage (200  $\mu$ Vp-p).

**FIGURE 3-2:** The MCP6541/2/3/4 comparators' internal hysteresis eliminates output chatter caused by input noise voltage.

#### 3.4.1 NON-INVERTING CIRCUIT

Figure 3-3 shows a non-inverting circuit for singlesupply applications using just two resistors. The resulting hysteresis diagram is shown in Figure 3-4.

FIGURE 3-3: Non-inverting circuit with hysteresis for single-supply.

FIGURE 3-4: Hysteresis Diagram for the Non-Inverting Circuit.

The trip points for Figures 3-3 and 3-4 are:

#### EQUATION

$$V_{TLH} = V_{REF} \left( I + \frac{R_I}{R_F} \right) - V_{OL} \left( \frac{R_I}{R_F} \right)$$
$$V_{THL} = V_{REF} \left( I + \frac{R_I}{R_F} \right) - V_{OH} \left( \frac{R_I}{R_F} \right)$$
$$V_{TIH} = \text{trip voltage from low to high}$$

 $V_{THL}$  = trip voltage from high to low

#### 3.4.2 INVERTING CIRCUIT

Figure 3-5 shows an inverting circuit for single-supply using three resistors. The resulting hysteresis diagram is shown in Figure 3-6.

FIGURE 3-5: Inverting Circuit With Hysteresis.

**FIGURE 3-6:** Hysteresis Diagram for the Inverting Circuit.

In order to determine the trip voltages (V<sub>THL</sub> and V<sub>TLH</sub>) for the circuit shown in Figure 3-5, R<sub>2</sub> and R<sub>3</sub> can be simplified to the Thevenin equivalent circuit with respect to V<sub>DD</sub>, as shown in Figure 3-7.

FIGURE 3-7: Thevenin Equivalent Circuit.

Where:

$$R_{23} = \frac{R_2 R_3}{R_2 + R_3}$$
$$V_{23} = \frac{R_3}{R_2 + R_3} \times V_{DD}$$

Using this simplified circuit, the trip voltage can be calculated using the following equation:

#### EQUATION

$$V_{THL} = V_{OH} \left( \frac{R_{23}}{R_{23} + R_F} \right) + V_{23} \left( \frac{R_F}{R_{23} + R_F} \right)$$
$$V_{TLH} = V_{OL} \left( \frac{R_{23}}{R_{23} + R_F} \right) + V_{23} \left( \frac{R_F}{R_{23} + R_F} \right)$$
$$V_{TLH} = \text{trip voltage from low to high}$$
$$V_{THL} = \text{trip voltage from high to low}$$

Figure 2-19 and Figure 2-22 can be used to determine typical values for  $V_{OH}$  and  $V_{OL}$ .

#### 3.5 Bypass Capacitors

With this family of comparators, the power supply pin (V<sub>DD</sub> for single supply) should have a local bypass capacitor (i.e., 0.01  $\mu$ F to 0.1  $\mu$ F) within 2 mm for good edge rate performance.

#### 3.6 Capacitive Loads

Reasonable capacitive loads (e.g., logic gates) have little impact on propagation delay (see Figure 2-27). The supply current increases with increasing toggle frequency (Figure 2-30), especially with higher capacitive loads.

#### 3.7 Battery Life

In order to maximize battery life in portable applications, use large resistors and small capacitive loads. Also, avoid toggling the output more than necessary and do not use chip select  $(\overline{CS})$  to conserve power for short periods of time. Capacitive loads will draw additional power at start-up.

#### 3.8 PCB Surface Leakage

In applications where low input bias current is critical, PCB (Printed Circuit Board) surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low humidity conditions, a typical resistance between nearby traces is  $10^{12}\Omega$ . A 5V difference would cause 5 pA, if current-to-flow. This is greater than the MCP6541/2/3/4 family's bias current at 25°C (1 pA, typ).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example of this type of layout is shown in Figure 3-8.

**FIGURE 3-8:** Example Guard Ring Layout for Inverting Circuit.

- 1. Inverting Configuration (Figures 3-5 and 3-8):
  - a. Connect the guard ring to the non-inverting input pin (V<sub>IN</sub>+). This biases the guard ring to the same reference voltage as the comparator (e.g.,  $V_{DD}/2$  or ground).
  - b. Connect the inverting pin ( $V_{IN}$ -) to the input pad without touching the guard ring.
- 2. Non-inverting Configuration (Figure 3-3):
  - a. Connect the non-inverting pin (V\_{IN}+) to the input pad without touching the guard ring.
  - Connect the guard ring to the inverting input pin (V<sub>IN</sub>-).

## 3.9 Typical Applications

#### 3.9.1 PRECISE COMPARATOR

Some applications require higher DC precision. An easy way to solve this problem is to use an amplifier (such as the MCP6041) to gain-up the input signal before it reaches the comparator. Figure 3-9 shows an example of this approach.

FIGURE 3-9: Comparator.

Precise Inverting

#### Comparator.

#### 3.9.2 WINDOWED COMPARATOR

Figure 3-10 shows one approach to designing a windowed comparator. The AND gate produces a logic '1' when the input voltage is between V<sub>RB</sub> and V<sub>RT</sub> (where V<sub>RT</sub> > V<sub>RB</sub>).

FIGURE 3-10:

Windowed Comparator.

#### 3.9.3 BISTABLE MULTI-VIBRATOR

A simple bistable multi-vibrator design is shown in Figure 3-11. V<sub>REF</sub> needs to be between the power supplies (V<sub>SS</sub> = GND and V<sub>DD</sub>) to achieve oscillation. The output duty cycle changes with V<sub>REF</sub>.

## 4.0 PACKAGING INFORMATION

## 4.1 Package Marking Information

\* Standard marking consists of Microchip part number, year code, week code, traceability code (facility code, mask rev#, and assembly code). For marking beyond this, certain price adders apply. Please check with your Microchip Sales Office.

## Package Marking Information (Continued)

14-Lead TSSOP (MCP6544)

Example:

#### Sales and Support

#### Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office

- 2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
- 3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

#### **Customer Notification System**

Register on our web site (www.microchip.com/cn) to receive the most current information on our products.

## MCP6541/2/3/4

NOTES:

#### Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is intended through suggestion only and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. No representation or warranty is given and no liability is assumed by Microchip Technology Incorporated with respect to the accuracy or use of such information, or infringement of patents or other intellectual property rights arising from such use or otherwise. Use of Microchip's products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any intellectual property rights.

#### Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, KEELOQ, MPLAB, PIC, PICmicro, PICSTART, PRO MATE and PowerSmart are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, microID, MXDEV, MXLAB, PICMASTER, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Accuron, Application Maestro, dsPICDEM, dsPICDEM.net, ECONOMONITOR, FanSense, FlexROM, fuzzyLAB, In-Circuit Serial Programming, ICSP, ICEPIC, microPort, Migratable Memory, MPASM, MPLIB, MPLINK, MPSIM, PICC, PICkit, PICDEM, PICDEM.net, PowerCal, PowerInfo, PowerMate, PowerTool, rfLAB, rfPIC, Select Mode, SmartSensor, SmartShunt, SmartTel and Total Endurance are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

Serialized Quick Turn Programming (SQTP) is a service mark of Microchip Technology Incorporated in the U.S.A.

All other trademarks mentioned herein are property of their respective companies.

© 2003, Microchip Technology Incorporated, Printed in the U.S.A., All Rights Reserved.

Microchip received QS-9000 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona in July 1999 and Mountain View, California in March 2002. The Company's quality system processes and procedures are QS-9000 compliant for its PICmicro® 8-bit MCUS, KEELoQ® code hopping devices, Serial EEPROMs, microperipherals, non-volatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001 certified.
