

VN5E016AH-E

16 mΩ high-side driver with analog current sense for automotive applications

Features

| | | |
|-----------------------------------|-------------------|---------------------|
| Max supply voltage | V _{CC} | 41V |
| Operating voltage range | V _{CC} | 4.5 to 28V |
| Max on-state resistance (per ch.) | R _{ON} | 16 mΩ |
| Current limitation (typ) | I _{LIMH} | 73 A |
| Off-state supply current | I _S | 2 μA ⁽¹⁾ |

1. Typical value with all loads connected.

- General
 - Inrush current active management by power limitation
 - Very low standby current
 - 3.0 V CMOS compatible inputs
 - Optimized electromagnetic emissions
 - Very low electromagnetic susceptibility
 - In compliance with the 2002/95/EC European directive
- Diagnostic functions
 - Proportional load current sense
 - High current sense precision for wide current range
 - Current sense disable
 - Off-state open-load detection
 - Output short to V_{CC} indication
 - Overload and short to ground (power limitation) indication
 - Thermal shutdown indication
- Protections
 - Undervoltage shutdown
 - Overvoltage clamp
 - Load current limitation
 - Self limiting of fast thermal transients
 - Protection against loss of ground and loss of V_{CC}
 - Overtemperature shutdown with auto restart (thermal shutdown)

- Reverse battery protected
- Electrostatic discharge protection

Applications

- All types of resistive, inductive and capacitive loads
- Suitable as LED driver

Description

The VN5E016AH-E is a single channel high-side driver manufactured in the ST proprietary VIPower™ M0-5 technology and housed in the tiny HPak package. The VN5E016AH-E is designed to drive 12 V automotive grounded loads delivering protection, diagnostics and easy 3 V and 5 V CMOS compatible interface with any microcontroller.

The device integrates advanced protective functions such as load current limitation, inrush and overload active management by power limitation, overtemperature shut-off with auto restart and overvoltage active clamp.

A dedicated analog current sense pin is associated with every output channel to provide enhanced diagnostic functions. These functions include fast detection of overload and short-circuit to ground through power limitation indication, overtemperature indication, short-circuit to V_{CC} diagnosis and ON-state and OFF-state open-load detection.

The current sensing and diagnostic feedback of the whole device can be disabled by pulling the CS_DIS pin high to allow sharing of the external sense resistor with other similar devices.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the “Absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality document.

Table 3. Absolute maximum ratings

| Symbol | Parameter | Value | Unit |
|-----------------|--|----------------------------|--------|
| V_{CC} | DC supply voltage | 41 | V |

| I_{OUT} | DC output current | Internally limited | A |
| $-I_{OUT}$ | Reverse DC output current | 20 | A |
| I_{IN} | DC input current | -1 to 10 | mA |
| I_{CS_D} | DC current sense disable input current | -1 to 10 | mA |
| V_{CS_SENSE} | Current sense maximum voltage ($V_{CC} > 0$) | $V_{CC} - 41$ $+V_{CC}$ | V V |
| E_{MAX} | Maximum switching energy (single pulse) ($L = 1.55$ mH; $R_L = 0\Omega$; $V_{bat} = 13.5V$; $T_{jstart} = 150^\circ C$; $I_{OUT} = I_{limL}(Typ.)$) | 350 | mJ |

1. To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles

3 Application information

Figure 32. Application schematic

3.1 GND protection network against reverse battery

3.1.1 Solution 1: resistor in the ground line (R_{GND} only)

This can be used with any type of load.

The following is an indication on how to dimension the R_{GND} resistor.

1. $R_{GND} \leq 600\text{mV} / (I_{S(on)max})$.
2. $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where -I_{GND} is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power dissipation in R_{GND} (when V_{CC}<0: during reverse battery situations) is:

Equation 1

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where I_{S(on)max} becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not shared by the device ground then the R_{GND} will produce a shift (I_{S(on)max} * R_{GND}) in the input thresholds and the status output

values. This shift will vary depending on how many devices are ON in the case of several high side drivers sharing the same R_{GND} .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then ST suggests to utilize Solution 2 (see below).

3.1.2 Solution 2: a diode (D_{GND}) in the ground line

A resistor ($R_{GND}=1k\Omega$) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network will produce a shift ($\approx 600mV$) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

3.2 Load dump protection

D_{ld} is necessary (voltage transient suppressor) if the load dump peak voltage exceeds the V_{CC} max DC rating. The same applies if the device is subject to transients on the V_{CC} line that are greater than the ones shown in the ISO T/R 7637/1 table.

3.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line to prevent the μC I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of μC and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of μC I/Os.

Equation 2

$$V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -100V$; $I_{latchup} \geq 20mA$; $V_{OH\mu C} \geq 4.5V$

$$5k\Omega \leq R_{prot} \leq 65k\Omega.$$

Recommended values: $R_{prot} = 10k\Omega$, $C_{EXT} = 10nF$.

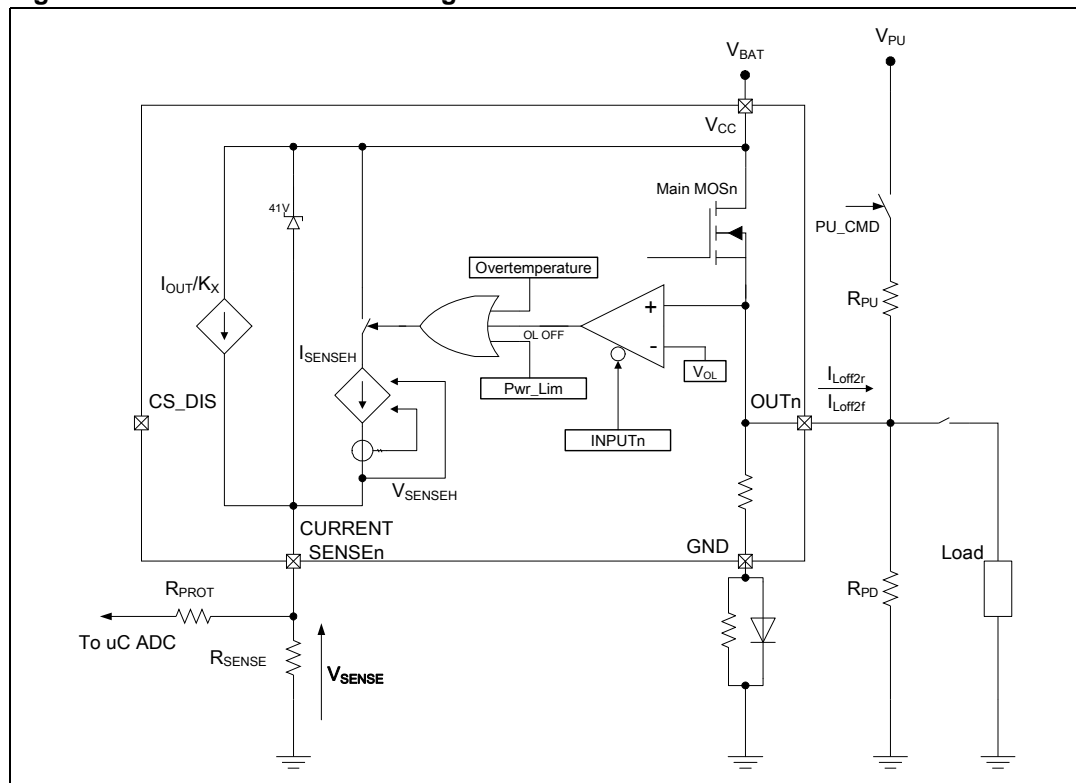

3.4 Current sense and diagnostic

The current sense pin performs a double function (see *Figure 33: Current sense and diagnostic*):

- **Current mirror of the load current in normal operation**, delivering a current proportional to the load one according to a know ratio K_x .
 The current I_{SENSE} can be easily converted to a voltage V_{SENSE} by means of an external resistor R_{SENSE} . Linearity between I_{OUT} and V_{SENSE} is ensured up to 5V minimum (see parameter V_{SENSE} in *Table 9: Current sense (8 V < V_{CC} < 18 V)*). The current sense accuracy depends on the output current (refer to current sense electrical characteristics *Table 9: Current sense (8 V < V_{CC} < 18 V)*).
- **Diagnostic flag in fault conditions**, delivering a fixed voltage V_{SENSEH} up to a maximum current I_{SENSEH} in case of the following fault conditions (refer to *Truth table*):
 - Power limitation activation
 - Overtemperature
 - Short to V_{CC} in OFF-state
 - Open-load in OFF-state with additional external components.

A logic level high on CS_DIS pin sets at the same time all the current sense pins of the device in a high impedance state, thus disabling the current monitoring and diagnostic detection. This feature allows multiplexing of the microcontroller analog inputs by sharing of sense resistance and ADC line among different devices.

Figure 33. Current sense and diagnostic

3.4.1 Short to V_{CC} and OFF-state open-load detection

Short to V_{CC}

A short circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off-state. Small or no current is delivered by the current sense during the on-state depending on the nature of the short circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU} .

It is preferable V_{PU} to be switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

An external pull down resistor R_{PD} connected between output and GND is mandatory to avoid misdetection in case of floating outputs in off-state (see [Figure 33: Current sense and diagnostic](#)).

R_{PD} must be selected in order to ensure $V_{OUT} < V_{OLmin}$ unless pulled up by the external circuitry:

Equation 3

$$V_{OUT}|_{Pull-up_OFF} = R_{PD} \cdot I_{L(off)2f} < V_{OLmin} = 2V$$

$R_{PD} \leq 22 \text{ K}\Omega$ is recommended.

For proper open-load detection in off-state, the external pull-up resistor must be selected according to the following formula:

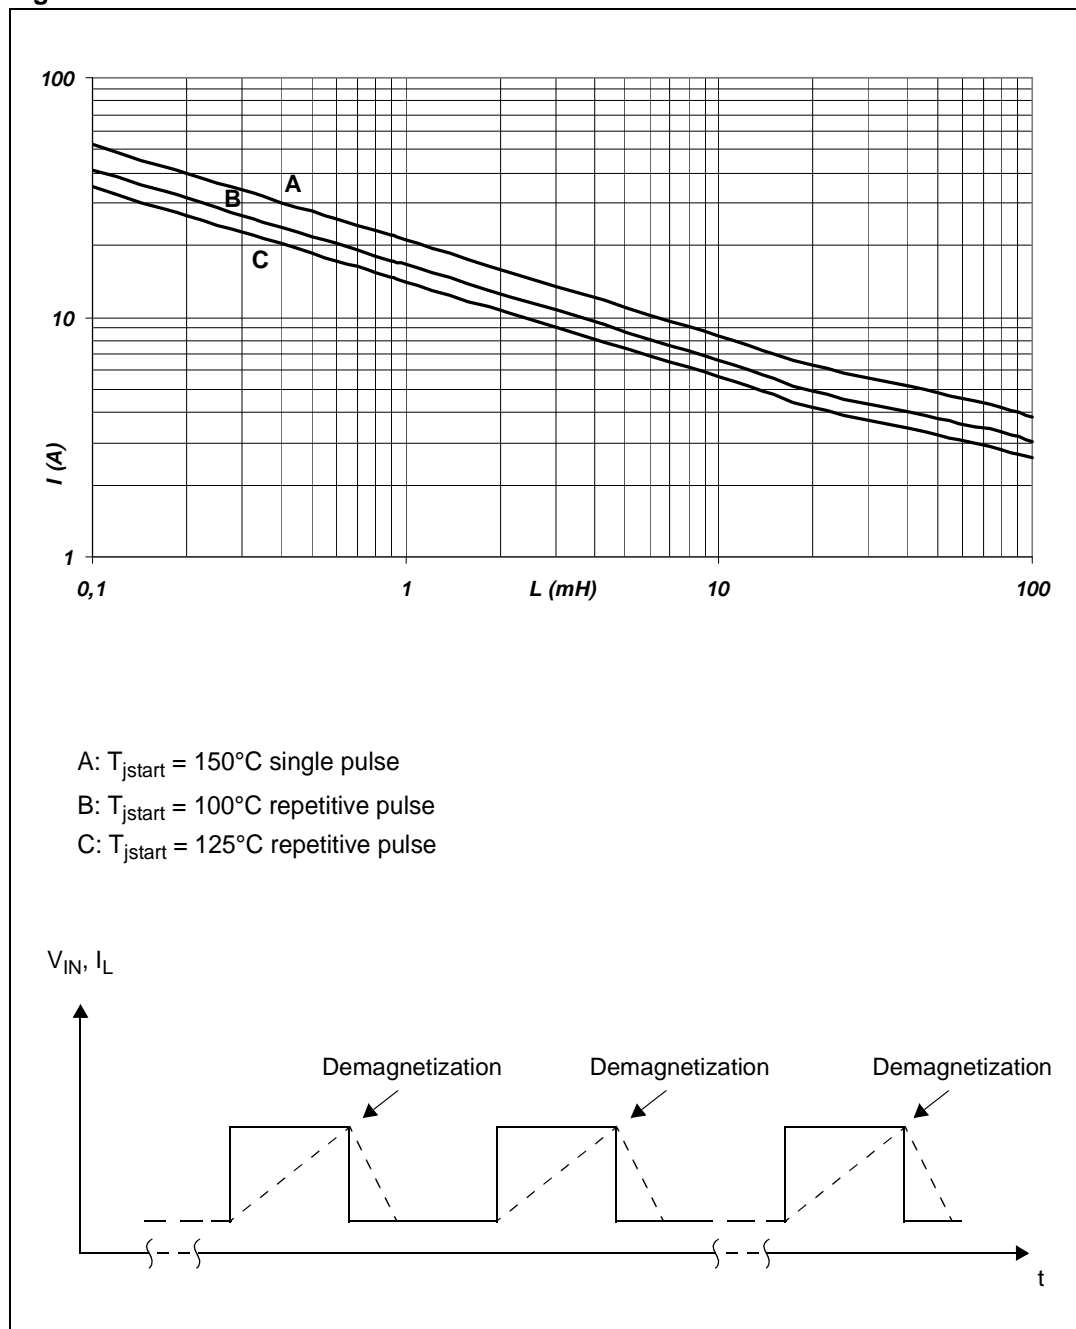

Equation 4

$$V_{OUT}|_{Pull-up_ON} = \frac{R_{PD} \cdot V_{PU} - R_{PU} \cdot R_{PD} \cdot I_{L(off)2r}}{R_{PU} + R_{PD}} > V_{OLmax} = 4V$$

For the values of V_{OLmin} , V_{OLmax} , $I_{L(off)2r}$ and $I_{L(off)2f}$ see [Table 10: Open-load detection \(8 V < \$V_{CC}\$ < 18 V\)](#).
