

AMIS-30600

LIN Transceiver

General Description

The single-wire transceiver AMIS-30600 is a monolithic integrated circuit in a SOIC-8 package. It works as an interface between the protocol controller and the physical bus.

The AMIS-30600 is especially suitable to drive the bus line in LIN systems in automotive and industrial applications. Further it can be used in standard ISO9141 systems.

In order to reduce the current consumption the AMIS-30600 offers a stand-by mode. A wake-up caused by a message on the bus pulls the INH-output high until the device is switched to normal operation mode.

The transceiver is implemented in I2T100 technology enabling both high-voltage analog circuitry and digital functionality to co-exist on the same chip.

The AMIS-30600 provides an ultra-safe solution to today's automotive in-vehicle networking (IVN) requirements by providing unlimited short circuit protection in the event of a fault condition.

Features

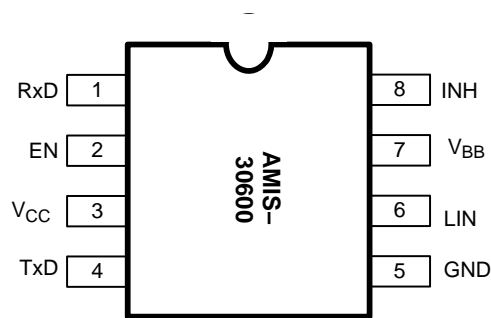

- LIN-Bus Transceiver
 - ♦ LIN compliant to specification rev. 1.3 and rev. 2.0
 - ♦ I2T high-voltage technology
 - ♦ Bus voltage ± 40 V
 - ♦ Transmission rate up to 20kbaud
 - ♦ SOIC-150-8 package
- Protection
 - ♦ Thermal shutdown
 - ♦ Indefinite short circuit protection to supply and ground
- Load dump protection (45 V)
- Power Saving
 - ♦ Operating voltage = 4.75 to 5.25 V
 - ♦ Power down supply current < 50 μ A
- EMS Compatibility
 - ♦ Integrated filter and hysteresis for receiver
- EMI Compatibility
 - ♦ Integrated slope control for transmitter
 - ♦ Slope control dependant from Vbat to enable maximum capacitive load
- These are Pb-Free Devices

The schematic diagram illustrates the LIN-BUS interface for the KL30 and KL31 modules. It features two identical circuit blocks, labeled 'Master Node' and 'Slave Node', connected to a common LIN-BUS line. Each node contains an AMIS-30600 LIN controller, a 5V-regulator, and various passive components. The Master Node is connected to VBAT, IN, and GND. The Slave Node is connected to VBAT, IN, and GND. The LIN-BUS line is connected to the LIN pin of both nodes. The diagram also shows the connection to the KL30 and KL31 modules and the PC20050113.5 component.

Table 1. PIN LIST AND DESCRIPTIONS

Pin	Name	Description
1	RxD	Receive data output; low in dominant state
2	EN	Enable input; transceiver in normal operation mode when high
3	VCC	5V supply input
4	TxD	Transmit data input; low in dominant state; internal 40 kΩ pullup
5	GND	Ground
6	LIN	LIN bus output/input; low in dominant state; internal 30 kΩ pullup
7	VBB	Battery supply input
8	INH	Inhibit output; to control a voltage regulator; becomes high when wake-up via LIN bus occurs

APPLICATION INFORMATION

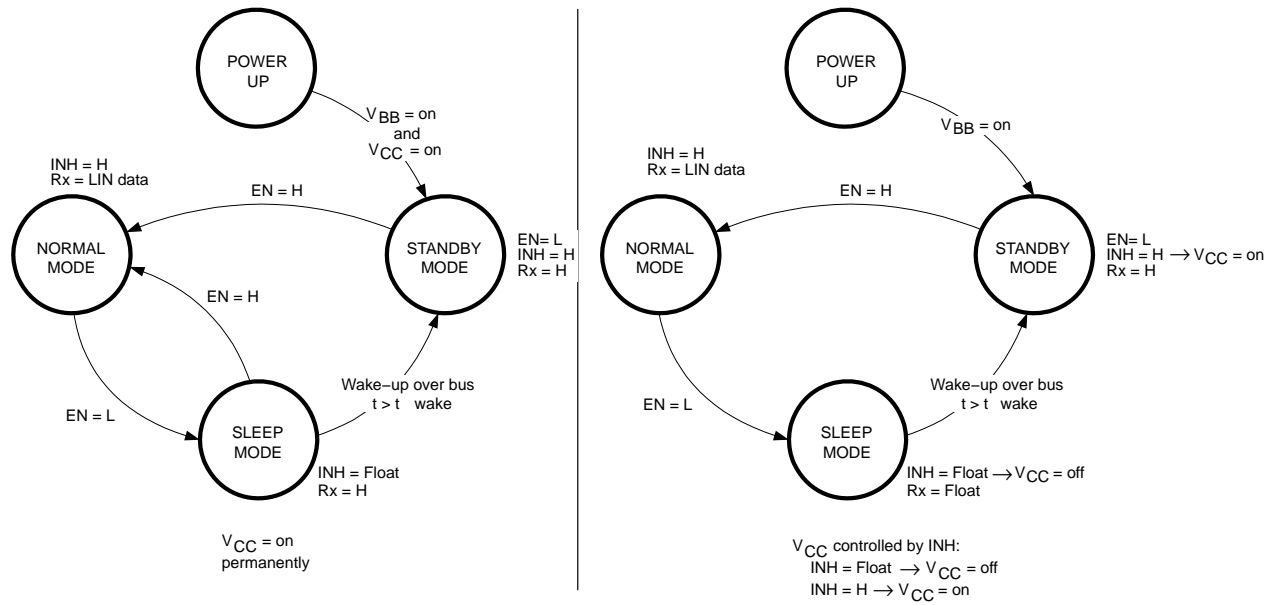

Figure 3. State Diagrams

The AMIS-30600 has a slope which depends of the supply V_{bat} . This implementation guarantees biggest slope-time under all load conditions. The rising slope has to be slower then the external RC-time-constant, otherwise the slope will be terminated by the RC-time-constant and no longer by the internal slope-control. This would affect the symmetry of the bus-signal and would limit the maximum allowed bus-speed.

A capacitor of 10 μF at the supply voltage input VB buffers the input voltage. In combination with the required reverse polarity diode this prevents the device from detecting power down conditions in case of negative transients on the supply line.

In order to reduce the current consumption, the AMIS-30600 offers a sleep operation mode. This mode is selected by switching the enable input EN low (see Figure 4).

An external voltage regulator can be controlled via the INH output in order to minimize the current consumption of the whole application in sleep mode (see Figure 2). A wake-up caused by a message on the communication bus automatically enables the voltage regulator by switching the INH output high (see Figure 3). In case the voltage regulator control input is not connected to the INH output, or the microcontroller is active respectively, the AMIS-30600 can be set in normal operation mode by EN = H (see Figure 3).
