## **High Speed Ultrasound Beamforming Source Driver**

#### **Features**

- ► Multiple-level ultrasound pulser
- ► Fast switching current source for push-pull topology
- ➤ 250MHz maximum frequency, 4.0ns input to output delay
- ▶ 15 independent programmable output level registers
- ▶ Pulse amplitude modulation (PAM) with 8-bit resolution
- ▶ 8-bit apodization DAC for peak output current via SPI
- Very low second order harmonic distortion
- Picoseconds time-jitter from input to output
- ► Fast SPI write and read-back of level & DAC registers
- ▶ +5.0V power supply, 2.5V CMOS logic interface
- ▶ Drives DN2625 MOSFETs output up to 230V<sub>P-P</sub>
- Programmable aperture windowing

## **Applications**

- Medical imaging ultrasound beamforming transmitter
- Dynamic focusing B-scan CW PW Doppler & FM chirp
- Ultrasonic phase array focusing transmitter
- Piezoelectric & MEMS transducer waveform drivers
- High speed arbitrary waveform generator
- High resolution NDT phase array ultrasound pulser

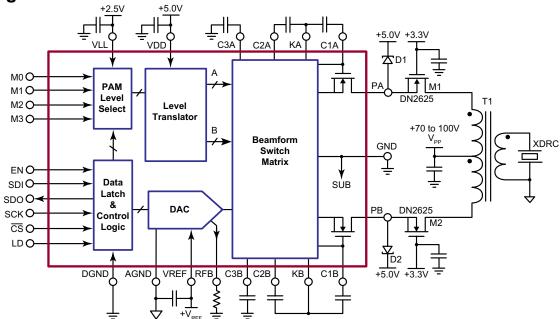

### **General Description**

The MD2134 is a high-speed source driver for use in a pulsed current waveform generator. This programmable, fast, arbitrary current level driver is designed for medical ultrasound imaging beamforming applications. It also can be used in HIFU, NDT ultrasound and other instrument applications.

The MD2134 consists of CMOS digital logic input circuits, an eight-bit current DAC for aperture weighting amplitude control, and a programmable 15-level pulse amplitude modulation (PAM) current-source that does not include a zero level. The fast current sources are constructed with current-switch array, controlled by the LV0~LV15 level-register as the waveform data points. Four logic inputs M[3:0] are used for transmit data level selecting, as well as the transmitting timing control pins. Each level can be programmed to a resolution of +/-127 including zero (8-bit) in addition to an 8-bit SPI apodization DAC. The outputs PA and PB are controlled by M[3:0] pins directly, as well as the polarity-flip bit S1 in the SPI register. The high-speed SPI interface will achieve per-scan-line fast data updating for dynamically changing delay time, weighting and waveforms.

The MD2134 outputs are designed to drive two very low-threshold, high-voltage depletion N-MOSFETs, such as Supertex's DN2625s, as source drivers. The two DN2625 drains are connected to a center-tap RF pulse transformer. The transformer's secondary output connects to a cable and piezoelectric or capacitive transducer as a load with a good impedance match.

## **Block Diagram**

## **Ordering Information**

Part Number	Package	Packing
MD2134K7-G	40-Lead (5x5) QFN	490/ Tray

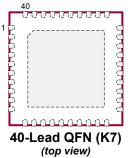

## **Absolute Maximum Ratings**

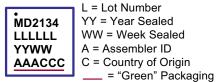

Parameter	Value
V <sub>LL</sub> , Logic supply	-0.5V to +3.5V
V <sub>DD</sub> , Positive supply	-0.5V to +6V
V <sub>PA</sub> , V <sub>PB</sub> Driver outputs	-0.5V to +6V
V <sub>SUB</sub> , Ground	0V
Operating temperature	0°C to +70°C
Storage temperature	-65°C to +150°C

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## **Pin Configuration**

## **Package Marking**

Package may or may not include the following marks: Si or

40-Lead QFN (K7)

## **Typical Thermal Resistance**

Package	$oldsymbol{ heta}_{j_{oldsymbol{a}}}$
40-Lead QFN	26°C/W

**Operating Supply Voltages** 

(Over operating conditions unless otherwise specified,  $V_{LL} = +2.5V$ ,  $V_{DD} = +5V$ ,  $V_{RE} = 2.5V$ ,  $R_{EB} = 71.1k\Omega$ ,  $T_{A} = 25^{\circ}C$ , DAC = 0)

#### Note:

S1 is Tx polarity swapping control bit. When S1 =  $0 LV1\sim7$  output to PA and  $LV8\sim15$  output to PB, when S1 =  $1 LV1\sim7$  output to PB and  $LV8\sim15$  output to PA.

#### Serial Port Interface (SPI) Read Write Timing for Control Register

#### **Tx Output Timing Diagram**

#### PA and PB Output Current Equations

The in-phase PA and 180° PB output sinking current magnitudes  $\rm I_A$  and  $\rm I_B$  can be calculated by the following equations.

$$I_A = \frac{48 \cdot V_{REF} \cdot DAC \cdot (2^6 - 1) \cdot \frac{LAx}{127}}{9 \cdot R_{FB}}$$

$$I_{B} = \frac{48 \cdot V_{REF} \cdot DAC \cdot (2^{6} - 1) \cdot \frac{LBx}{127}}{9 \cdot R_{FB}}$$

Where the  $V_{\rm REF}$  is the voltage reference, DAC is the decimal value of the data in the DAC register,  $R_{\rm FB}$  is the setting resistor value in ohms, LAx or LBx is the decimal value of the data in the level register.

The values of the results from the equations represent the magnitude of the output current. The current flow into the port PA or PB is controlled by M0, M1, M2 or M3 are turned on. Note that the maximum full scale peak current at PA or PB port only can be obtained at DAC = 255,  $V_{REF}$  = 2.5V,  $R_{FB}$  = 71.1k $\Omega$ , LAx[6:0] = 127 for PA or LBx[6:0] = 127 for PR

22 VREF External reference voltage input. 23 RFB Resistor to GND, 71.1kΩ 0.1% for the best accuracy. 24 GND High current output ground. 25 C3B Bypass cap to GND of Pin #24, 10nF low ESR X7R ceramic cap. 26 VDD Supplies voltage of the gate driver and internal analog circuit. 27 GND High current output ground. 28 C1B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 29 GND High current output ground. 30 KB Kelvin connection B. 31 C2B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 32 PB Current sinking source driver output B, external Schottky diode to VDD. 33 PB Current sinking source driver output B, external Schottky diode to VDD. 34 PB Current sinking source driver output B, external Schottky diode to VDD. 35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 37 PA Current sinking source driver output A, external Schottky diode to VDD. 38 PA Current sinking source driver output A, external Schottky diode to VDD.	20	LD	
RFB Resistor to GND, 71.1kΩ 0.1% for the best accuracy.  High current output ground.  Supplies voltage of the gate driver and internal analog circuit.  High current output ground.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  Supplies voltage of the gate driver and internal analog circuit.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  High current output ground.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  RFB Resistor to GND of Pin #24, 10nF low ESR X7R ceramic cap.  RFB Current sinking source driver output B, external Schottky diode to VDD.  RFB Current sinking source driver output B, external Schottky diode to VDD.  RFB Current sinking source driver output B, external Schottky diode to VDD.  RFB Current sinking source driver output A, external Schottky diode to VDD.  RFB Current sinking source driver output A, external Schottky diode to VDD.  RFB Current sinking source driver output A, external Schottky diode to VDD.	21	EN	Enable, EN = Low, PA = PB = Hi-Z and all internal registers freeze until next clock rising edge.
24 GND High current output ground. 25 C3B Bypass cap to GND of Pin #24, 10nF low ESR X7R ceramic cap. 26 VDD Supplies voltage of the gate driver and internal analog circuit. 27 GND High current output ground. 28 C1B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 29 GND High current output ground. 30 KB Kelvin connection B. 31 C2B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 32 PB Current sinking source driver output B, external Schottky diode to VDD. 33 PB Current sinking source driver output B, external Schottky diode to VDD. 34 PB Current sinking source driver output B, external Schottky diode to VDD. 35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 37 PA Current sinking source driver output A, external Schottky diode to VDD. 38 PA Current sinking source driver output A, external Schottky diode to VDD.	22	VREF	External reference voltage input.
25 C3B Bypass cap to GND of Pin #24, 10nF low ESR X7R ceramic cap. 26 VDD Supplies voltage of the gate driver and internal analog circuit. 27 GND High current output ground. 28 C1B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 29 GND High current output ground. 30 KB Kelvin connection B. 31 C2B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 32 PB Current sinking source driver output B, external Schottky diode to VDD. 33 PB Current sinking source driver output B, external Schottky diode to VDD. 34 PB Current sinking source driver output B, external Schottky diode to VDD. 35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 37 PA Current sinking source driver output A, external Schottky diode to VDD. 38 PA Current sinking source driver output A, external Schottky diode to VDD.	23	RFB	Resistor to GND, 71.1kΩ 0.1% for the best accuracy.
26 VDD Supplies voltage of the gate driver and internal analog circuit.  27 GND High current output ground.  28 C1B Bypass cap to KB, 10nF low ESR X7R ceramic cap.  29 GND High current output ground.  30 KB Kelvin connection B.  31 C2B Bypass cap to KB, 10nF low ESR X7R ceramic cap.  32 PB Current sinking source driver output B, external Schottky diode to VDD.  33 PB Current sinking source driver output B, external Schottky diode to VDD.  34 PB Current sinking source driver output B, external Schottky diode to VDD.  35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  37 PA Current sinking source driver output A, external Schottky diode to VDD.  38 PA Current sinking source driver output A, external Schottky diode to VDD.  39 PA Current sinking source driver output A, external Schottky diode to VDD.	24	GND	High current output ground.
27 GND High current output ground.  28 C1B Bypass cap to KB, 10nF low ESR X7R ceramic cap.  29 GND High current output ground.  30 KB Kelvin connection B.  31 C2B Bypass cap to KB, 10nF low ESR X7R ceramic cap.  32 PB Current sinking source driver output B, external Schottky diode to VDD.  33 PB Current sinking source driver output B, external Schottky diode to VDD.  34 PB Current sinking source driver output B, external Schottky diode to VDD.  35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  37 PA Current sinking source driver output A, external Schottky diode to VDD.  38 PA Current sinking source driver output A, external Schottky diode to VDD.  39 PA Current sinking source driver output A, external Schottky diode to VDD.	25	C3B	Bypass cap to GND of Pin #24, 10nF low ESR X7R ceramic cap.
28 C1B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 29 GND High current output ground. 30 KB Kelvin connection B. 31 C2B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 32 PB Current sinking source driver output B, external Schottky diode to VDD. 33 PB Current sinking source driver output B, external Schottky diode to VDD. 34 PB Current sinking source driver output B, external Schottky diode to VDD. 35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 37 PA Current sinking source driver output A, external Schottky diode to VDD. 38 PA Current sinking source driver output A, external Schottky diode to VDD. 39 PA Current sinking source driver output A, external Schottky diode to VDD.	26	VDD	Supplies voltage of the gate driver and internal analog circuit.
GND High current output ground.  KB Kelvin connection B.  Bypass cap to KB, 10nF low ESR X7R ceramic cap.  C2B Bypass cap to KB, 10nF low ESR X7R ceramic cap.  Current sinking source driver output B, external Schottky diode to VDD.  Current sinking source driver output B, external Schottky diode to VDD.  Current sinking source driver output B, external Schottky diode to VDD.  Substrate voltage must connect to the lowest potential of the IC, the ground.  VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  Current sinking source driver output A, external Schottky diode to VDD.  Current sinking source driver output A, external Schottky diode to VDD.  Current sinking source driver output A, external Schottky diode to VDD.	27	GND	High current output ground.
30 KB Kelvin connection B. 31 C2B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 32 PB Current sinking source driver output B, external Schottky diode to VDD. 33 PB Current sinking source driver output B, external Schottky diode to VDD. 34 PB Current sinking source driver output B, external Schottky diode to VDD. 35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 37 PA Current sinking source driver output A, external Schottky diode to VDD. 38 PA Current sinking source driver output A, external Schottky diode to VDD. 39 PA Current sinking source driver output A, external Schottky diode to VDD.	28	C1B	Bypass cap to KB, 10nF low ESR X7R ceramic cap.
31 C2B Bypass cap to KB, 10nF low ESR X7R ceramic cap. 32 PB Current sinking source driver output B, external Schottky diode to VDD. 33 PB Current sinking source driver output B, external Schottky diode to VDD. 34 PB Current sinking source driver output B, external Schottky diode to VDD. 35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 37 PA Current sinking source driver output A, external Schottky diode to VDD. 38 PA Current sinking source driver output A, external Schottky diode to VDD. 39 PA Current sinking source driver output A, external Schottky diode to VDD.	29	GND	High current output ground.
PB Current sinking source driver output B, external Schottky diode to VDD.  Read Current sinking source driver output B, external Schottky diode to VDD.  Current sinking source driver output B, external Schottky diode to VDD.  Substrate voltage must connect to the lowest potential of the IC, the ground.  VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  Current sinking source driver output A, external Schottky diode to VDD.  Current sinking source driver output A, external Schottky diode to VDD.  Current sinking source driver output A, external Schottky diode to VDD.	30	KB	Kelvin connection B.
PB Current sinking source driver output B, external Schottky diode to VDD.  Current sinking source driver output B, external Schottky diode to VDD.  Substrate voltage must connect to the lowest potential of the IC, the ground.  VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  Current sinking source driver output A, external Schottky diode to VDD.  Current sinking source driver output A, external Schottky diode to VDD.  PA Current sinking source driver output A, external Schottky diode to VDD.	31	C2B	Bypass cap to KB, 10nF low ESR X7R ceramic cap.
34 PB Current sinking source driver output B, external Schottky diode to VDD.  35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  37 PA Current sinking source driver output A, external Schottky diode to VDD.  38 PA Current sinking source driver output A, external Schottky diode to VDD.  39 PA Current sinking source driver output A, external Schottky diode to VDD.	32	PB	Current sinking source driver output B, external Schottky diode to VDD.
35 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground. 37 PA Current sinking source driver output A, external Schottky diode to VDD. 38 PA Current sinking source driver output A, external Schottky diode to VDD. 39 PA Current sinking source driver output A, external Schottky diode to VDD.	33	PB	Current sinking source driver output B, external Schottky diode to VDD.
36 VSUB Substrate voltage must connect to the lowest potential of the IC, the ground.  37 PA Current sinking source driver output A, external Schottky diode to VDD.  38 PA Current sinking source driver output A, external Schottky diode to VDD.  39 PA Current sinking source driver output A, external Schottky diode to VDD.	34	PB	Current sinking source driver output B, external Schottky diode to VDD.
37 PA Current sinking source driver output A, external Schottky diode to VDD.  38 PA Current sinking source driver output A, external Schottky diode to VDD.  39 PA Current sinking source driver output A, external Schottky diode to VDD.	35	VSUB	Substrate voltage must connect to the lowest potential of the IC, the ground.
38 PA Current sinking source driver output A, external Schottky diode to VDD.  39 PA Current sinking source driver output A, external Schottky diode to VDD.	36	VSUB	Substrate voltage must connect to the lowest potential of the IC, the ground.
38 PA Current sinking source driver output A, external Schottky diode to VDD.  39 PA Current sinking source driver output A, external Schottky diode to VDD.	37	PA	Current sinking source driver output A, external Schottky diode to VDD.
39 PA Current sinking source driver output A, external Schottky diode to VDD.			
	39	PA	

#### Notes:

- Pin # 35 & #36 are V<sub>SUB</sub> connected to the center thermal pad internally in the package.
   All bypass capacitors need be very close to the pins

## 40-Lead QFN Package Outline (K7)

## 5.00x5.00mm body, 0.80mm height (max), 0.40mm pitch

#### Notes:

- 1. A Pin 1 identifier must be located in the index area indicated. The Pin 1 identifier can be: a molded mark/identifier; an embedded metal marker; or a printed indicator.
- 2. Depending on the method of manufacturing, a maximum of 0.15mm pullback (L1) may be present.
- 3. The inner tip of the lead may be either rounded or square.
