## MAX6070/MAX6071

## Low-Noise, High-Precision Series Voltage References

### General Description

The MAX6070/MAX6071 offer a very low noise and low-drift voltage reference in a small 6-pin SOT23 package. These devices provide a 1/f noise voltage of only  $4.8\mu V_{P-P}$  at an output voltage of 2.5V, with a temperature drift of  $6\text{ppm}/^\circ C$  (max). The devices consume  $150\mu A$  of supply current and can sink and source up to  $10\text{mA}$  of load current. The low-drift and low-noise specifications enable enhanced system accuracy, making these devices ideal for high-precision industrial applications. The MAX6070 offers a noise filter option for wideband applications.

The devices are available in a 6-pin SOT23 package and are specified over the extended industrial temperature range of  $-40^\circ C$  to  $+125^\circ C$ . The 2.5V options are also available in a 6-bump  $0.78\text{mm} \times 1.41\text{mm}$  wafer-level package (WLP).

### Applications

- High-Accuracy Industrial and Process Control
- Precision Instrumentation
- High-Resolution ADCs and DACs
- Precision Current Sources

### Benefits and Features

- 6-Pin SOT23 Package Reduces System Board Space
- Stable Performance Over Temperature and Time Improves System Accuracy
  - High  $\pm 0.04\%$  Initial Accuracy
  - Low  $1.5\text{ppm}/^\circ C$  (typ),  $6\text{ppm}/^\circ C$  (max) Temperature Drift
  - Low  $4.8\mu V_{P-P}$  Noise (0.1Hz to 10Hz) at 2.5V
  - Low 200mV Dropout Voltage
  - High 85dB Ripple Rejection
- Low  $150\mu A$  Supply Current Reduces Power Consumption
- Filter Option Lowers High-Frequency Noise
- Output Options: 1.25V, 1.8V, 2.048V, 2.5V, 3.0V, 3.3V, 4.096V, and 5.0V Cover Common Voltage Levels for a Wide Variety of Applications
- $0.78\text{mm} \times 1.41\text{mm}$  WLP with 0.35mm Bump Spacing
- AEC-Q100 Qualified (Refer to [Ordering Information](#))

[Ordering Information](#) and [Selector Guide](#) appears at end of data sheet.

### Typical Operating Circuits

**Absolute Maximum Ratings**

OUT to GNDS, GNDF, GND.....	-0.3V to the lower of ( $V_{IN} + 0.3V$ ), +6V
OUTS to GNDS, GNDF, GND .....	-0.3V to +6V
IN to GNDS, GNDF, GND .....	-0.3V to +6V
EN to GNDS, GNDF, GND .....	-0.3V to +6V
FILTER to GND.....	-0.3V to the lower of ( $V_{IN} + 0.3V$ ), +6V
GNDS to GNDF .....	-0.3V to +0.3V

Continuous Power Dissipation ( $T_A = +70^\circ C$ )	
SOT23 (derate 4.3mW/ $^\circ C$ above $+70^\circ C$ ).....	347.8mW
WLP (derate 10.2mW/ $^\circ C$ above $70^\circ C$ .....	816mW
Operating Temperature Range.....	-40 $^\circ C$ to +125 $^\circ C$
Junction Temperature .....	+150 $^\circ C$
Storage Temperature Range.....	-65 $^\circ C$ to +150 $^\circ C$
Soldering Temperature (reflow) .....	+260 $^\circ C$
Lead Temperature (soldering, 10s) .....	+300 $^\circ C$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Package Thermal Characteristics (Note 1)**

SOT23

Junction-to-Ambient Thermal Resistance ( $\theta_{JA}$ ).....230 $^\circ C/W$ Junction-to-Case Thermal Resistance ( $\theta_{JC}$ ).....76 $^\circ C/W$ 

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

**Electrical Characteristics—MAX607\_AUT12 ( $V_{OUT} = 1.250V$ )**

## Pin Configurations

## Pin Description

PIN		NAME	FUNCTION
MAX6070	MAX6071		
1	—	FILTER	Filter Input. Connect a 0.1µF capacitor from FILTER to ground to provide high-frequency bypass. Leave unconnected, if not used.
—	1	GNDF	Ground Force
2	—	GND	Ground
-	2	GNDS	Ground Sense. Connect to ground connection at the load.
3	3	EN	Enable. Drive high to enable the device. Drive low to disable the device.
4	4	IN	Supply Input
5	5	OUTS	Voltage Reference Sense Output
6	6	OUTF	Voltage Reference Force Output. Short OUTF to OUTS as close as possible to the load. Bypass OUTF with a capacitor (0.1µF to 10µF) to GND.

**Bump Configuration****Bump Description**

BUMP	NAME	FUNCTION
A1	EN	Enable. Drive high to enable the device. Drive low to disable the device.
A2	GNDS	Ground Sense. Connect to ground connection at the load.
A3	GNDF	Ground Force
B1	OUTS	Voltage Reference Sense Output
B2	OUTF	Voltage Reference Force Output. Short OUTF to OUTS as close as possible to the load. Bypass OUTF with a capacitor (0.1µF to 10µF) to GNDF.
B3	IN	Supply Input. Connect a 0.1µF capacitor to GNDF.

## Detailed Description

### Wideband Noise Reduction (FILTER)

To improve wideband noise and transient power-supply noise with the MAX6070, connect a 0.1 $\mu$ F capacitor from FILTER to GND (see the [Typical Operating Characteristics](#)). Larger values do not appreciably improve noise reduction. A 0.1 $\mu$ F capacitor reduces the spectral noise density at 1kHz from 60nV/ $\sqrt{\text{Hz}}$  to 30nV/ $\sqrt{\text{Hz}}$  for the 2.5V output. Noise at the input pin can affect output noise, but can be reduced by connecting an optional bypass capacitor between IN and GND as shown in [Figure 1](#).

### Output Bypassing

The MAX6070/MAX6071 require an output capacitor between 0.1 $\mu$ F and 10 $\mu$ F. Place the output capacitor as close to OUTF as possible. For applications driving switching capacitive loads or rapidly changing load currents, use a 0.1 $\mu$ F capacitor in parallel with a larger load capacitor to reduce equivalent series resistance (ESR). Larger capacitor values and lower ESR reduce transients on the reference output.

### Supply Current

The MAX6070/MAX6071 draw 150 $\mu$ A of current and are virtually independent of the supply voltage, with only a 1.6 $\mu$ A/V variation with supply voltage.

### Thermal Hysteresis

Thermal hysteresis is the change of output voltage at  $T_A = +25^\circ\text{C}$  before and after the device is cycled over its entire operating temperature range. The typical thermal hysteresis value is 85ppm.

### Turn-On Time

These devices typically turn on and settle to within 0.01% of their final value in 30 $\mu$ s. A noise reduction capacitor of 0.1 $\mu$ F increases the turn-on time of the MAX6070 to 10ms.

### Output Force and Sense

The MAX6070/MAX6071 provide independent connections for the force output (OUTF) supplying current to the load and the circuit input regulating the load voltage via the output sense pin (OUTS). This configuration allows for the cancellation of the voltage drop on the lines connecting the MAX6070/MAX6071 and the load. When using the Kelvin connection made possible by the independent force and sense outputs, connect OUTF to the load and

connect OUTS to OUTF at the point where the voltage accuracy is needed (see [Figure 1](#)). The MAX6071 features the same type of Kelvin connection to cancel drops in the ground return line. Connect the load to ground and connect GNDS to ground as close as possible to the load ground connection (see [Figure 2](#)).

### Shutdown

The MAX6070/MAX6071 feature an active-high enable pin (EN). Pulling EN low disables the output with a resistive load to ground and forces the quiescent current to less than 1 $\mu$ A. The value of the load is typically 200k $\Omega$ . Pulling EN high enables normal operation.

## Applications Information

### Wideband Noise Reduction

[Figure 1](#) shows a typical noise reduction filter application circuit. Note that the use of the wideband noise filter will increase turn-on time.

### High-Resolution DAC and Reference from a Single Supply

[Figure 2](#) shows a typical circuit providing the reference for a high-resolution, 16-bit MAX541 DAC.

### Precision Current Source

[Figure 3](#) shows a typical circuit providing a precision current source. The OUTF output provides the bias current for the bipolar transistor. OUTS and GNDS sense the voltage across the resistor and adjust the current sourced by OUTF accordingly.

Figure 1. Reference Output Kelvin Connection

Figure 2. Reference Ground Kelvin Connection

### Long-Term Drift and Humidity Effects

There are many factors that contribute to a voltage reference's drift over time. These can include package stress, board stress and layout, humidity and part-to-part variation. In an effort to better quantify the drift of the MAX6070 core over time, Maxim has evaluated 16 samples on two identical bench setups. Sixteen MAX6070AAUT25+ samples were installed on a pair of development boards. One board was set up in a humidity and temperature controlled oven. The conditions were set to 25°C and 40% relative humidity. The second board was set up on the lab bench in the open air, where humidity was measured to fluctuate between 18% and 51%.

The results of these experiments are detailed in Figures 4, 5, and 6. The latest data shows the drift out to 5,800 hours. The y axis is the drift, measured in parts per million, between +50ppm and -50ppm. Figure 4 shows the 16 parts on the lab bench in the open air. It is here the effects of the humidity fluctuating between 18% and 51% can be seen.

Figure 5 details the same set up in the humidity controlled oven. Temperature (25°C) and humidity (40%) are relatively consistent inside the oven. Data was affected a bit at about the

2,500 hour mark when the pump that regulates the humidity temporarily stopped working for about 48 hours. This caused a brief spike in the output voltages before they returned to their previous profile.

Figure 6 shows the results of temperature and humidity measurements both inside and outside the oven. The key parameter to note is the purple line which represents the humidity outside

Figure 3. Precision Current Source

the oven (on the lab bench). The swings in humidity are apparent in Figure 4, with the output voltage drift primarily tracking the humidity changes.

Maxim is studying the effects of drift and humidity on multiple references beyond 1,000 hours. Contact the Maxim technical support line or your local sales office for details on the latest data.
