S-1133 Series

HIGH RIPPLE-REJECTION AND LOW DROPOUT
MIDDLE-OUTPUT CURRENT CMOS VOLTAGE REGULATOR

Rev.3.1_02

The S-1133 Series is a positive voltage regulator with a low dropout voltage, high output voltage accuracy, and low current consumption (300 mA output current) developed based on CMOS technology.

A 1 μF small ceramic capacitor can be used[*1]. It operates with low current consumption of 60 μA typ. The S-1133 Series includes an overcurrent protection circuit that prevents the output current from exceeding the current capacity of the output transistor and a thermal shutdown circuit that prevents damage due to overheating.

In addition to the types in which output voltage is set inside the IC, a type for which output voltage can be set via an external resistor is added to a lineup (S-1133x00 Series). SOT-89-5 and super-small SNT-8A packages realize high-density mounting. This, in addition to low current consumption, makes the S-1133 Series ideal for mobile devices.

*1. A ceramic capacitor of 2.2 μF or more can be used for products whose output voltage is 1.7 V or less.

■ Features

- Output voltage (internally set):   1.2 V to 6.0 V, selectable in 0.1 V step.
- Output voltage (externally set):   1.8 V to 8.2 V, settable via external resistor
                                       (S-1133B00/S-1133A00)
- Input voltage: 2.0 V to 10 V
- Output voltage accuracy: $\pm$1.0% (1.2 V to 1.4 V output product: $\pm$15 mV)
- Dropout voltage: 130 mV typ. (3.0 V output product, I_{OUT} = 100 mA)
- Current consumption: During operation: 60 μA typ., 90 μA max.
                           During power-off: 0.1 μA typ., 1.0 μA max.
- Output current: Possible to output 300 mA ($V_{IN} \geq V_{OUT(S)}$ + 1.0 V)[*1]
- Input and output capacitors: A ceramic capacitor of 1.0 μF or more can be used.
                                    (A ceramic capacitor of 2.2 μF or more can be used for products whose output voltage is 1.7 V or less.)
- Ripple rejection: 70 dB typ. (1.2 V output product, f = 1.0 kHz)
- Built-in overcurrent protection circuit: Limits overcurrent of output transistor.
- Built-in thermal shutdown circuit: Prevents damage caused by heat.
- Built-in ON / OFF circuit: Ensures long battery life.
- Operation temperature range: Ta = -40°C to $+85^{\circ}$C
- Lead-free, Sn 100%, halogen-free[*2]

*1.   Attention should be paid to the power dissipation of the package when the output current is large.
*2.   Refer to "■ **Product Name Structure**" for details.

■ Applications

- Power supply for battery-powered devices
- Power supply for communication devices
- Power supply for home electric appliances

■ Packages

- SOT-89-5
- SNT-8A

■ Block Diagrams

### 1. Types in which output voltage is internally set (S-1133x12 to S-1133x60)

*1. Parasitic diode

■ Product Name Structure

- The product types, output voltage, and package types for the S-1133 Series can be selected at the user's request. Refer to the "**1.   Product name**" for the meanings of the characters in the product name, "**2.   Package**" regarding the package drawings and "**3.   Product name list**" for the full product names.
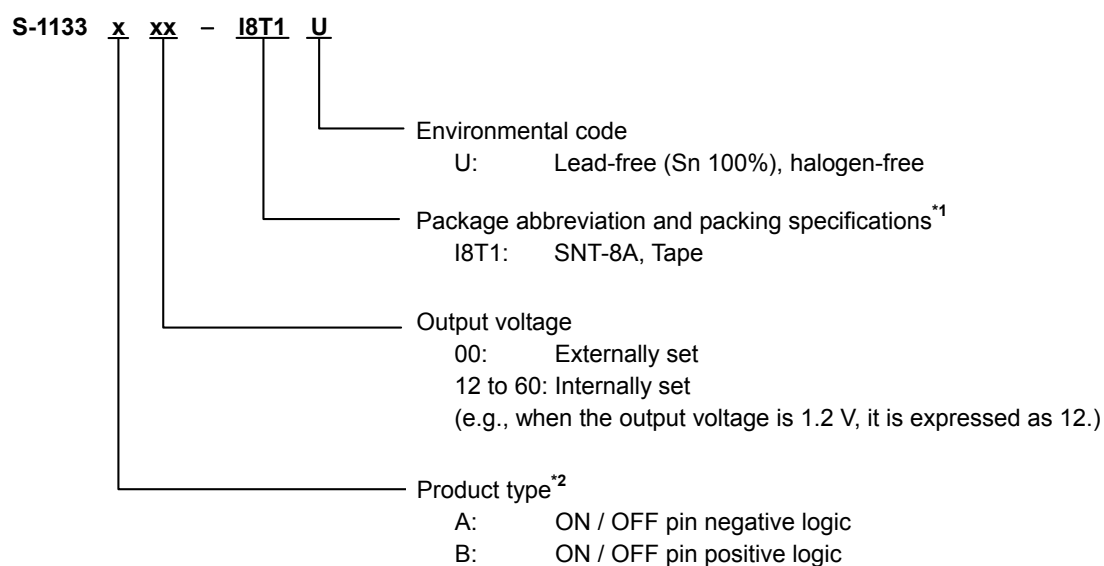

1.   Product name

1. 1   SOT-89-5

S-1133 <u>x</u> <u>xx</u> – <u>U5T1</u> <u>x</u>

Environmental code
   U: Lead-free (Sn 100%), halogen-free
   G: Lead-free (for details, please contact our sales office)

Package abbreviation and packing specifications[1]
   U5T1:   SOT-89-5, Tape

Output voltage
   00:          Externally set
   12 to 60: Internally set
   (e.g., when the output voltage is 1.2 V, it is expressed as 12.)

Product type[2]
   A: ON / OFF pin negative logic
   B: ON / OFF pin positive logic

*1.   Refer to the tape drawing.
*2.   Refer to "**3. ON / OFF pin**" in "**■ Operation**".

1. 2   SNT-8A

S-1133 <u>x</u> <u>xx</u> – <u>I8T1</u> <u>U</u>

Environmental code
   U: Lead-free (Sn 100%), halogen-free

Package abbreviation and packing specifications[1]
   I8T1:   SNT-8A, Tape

Output voltage
   00:          Externally set
   12 to 60: Internally set
   (e.g., when the output voltage is 1.2 V, it is expressed as 12.)

Product type[2]
   A: ON / OFF pin negative logic
   B: ON / OFF pin positive logic

*1.   Refer to the tape drawing.
*2.   Refer to "**3. ON / OFF pin**" in "**■ Operation**".

2. Packages

Package Name	Drawing Code			
	Package	Tape	Reel	Land
SOT-89-5	UP005-A-P-SD	UP005-A-C-SD	UP005-A-R-SD	UP005-A-L-S1
SNT-8A	PH008-A-P-SD	PH008-A-C-SD	PH008-A-R-SD	PH008-A-L-SD

■ Pin Configurations

1. SOT-89-5

Top view

Figure 3

Table 2

Pin No.	Symbol	Description
1	VADJ	Output voltage adjustment pin (S-1133B00/S-1133A00 only)
	NC*1	No connection (S-1133x12 to S-1133x60)
2	VSS	GND pin
3	ON / OFF	ON / OFF pin
4	VIN	Voltage input pin
5	VOUT	Voltage output pin

*1. The NC pin is electrically open.
The NC pin can be connected to the VIN pin or the VSS pin.

2. SNT-8A

Top view
Figure 4

Table 3

Pin No.	Pin Name	Functions
1	VOUT*1	Voltage output pin
2	VOUT*1	Voltage output pin
3	NC*2	No connection (S-1133x12 to S-1133x60)
	VADJ	Output voltage adjustment pin (S-1133B00/S-1133A00 only)
4	NC*2	No connection
5	VSS	GND pin
6	ON / OFF	ON / OFF pin
7	VIN*3	Voltage input pin
8	VIN*3	Voltage input pin

*1. Although pins of number 1 and 2 are connected internally, be sure to short-circuit them nearest in use.

*2. The NC pin is electrically open.
The NC pin can be connected to the VIN pin or the VSS pin.

*3. Although pins of number 7 and 8 are connected internally, be sure to short-circuit them nearest in use.

■ Absolute Maximum Ratings

Table 4

(Ta = +25 °C unless otherwise specified)

Item		Symbol	Absolute Maximum Rating	Unit
Input voltage		V_{IN}	$V_{SS} - 0.3$ to $V_{SS} + 12$	V
		$V_{ON / OFF}$	$V_{SS} - 0.3$ to $V_{SS} + 12$	V
		V_{ADJ}	$V_{SS} - 0.3$ to $V_{SS} + 12$	V
Output voltage		V_{OUT}	$V_{SS} - 0.3$ to $V_{IN} + 0.3$	V
Power dissipation	SOT-89-5	P_D	1000[*1]	mW
	SNT-8A		450[*1]	mW
Operation ambient temperature		T_{opr}	−40 to +85	°C
Storage temperature		T_{stg}	−40 to +125	°C

*1. When mounted on printed circuit board
    [Mounted Board]
      (1) Board size :   114.3 mm × 76.2 mm × t1.6 mm
      (2) Board name : JEDEC STANDARD51-7

Caution   **The absolute maximum ratings are rated values exceeding which the product could suffer physical damage.   These values must therefore not be exceeded under any conditions.**
Figure 5 Power Dissipation of Packages (Mounted on Printed Circuit Board)

Caution   **The thermal shutdown circuit may operate when the junction temperature is around 150 °C.**

Load regulation	ΔV_{OUT2}	$V_{IN} = V_{OUT(S)} + 1.0$ V, 1.0 mA $\leq I_{OUT} \leq 100$ mA		—	15	40	mV	1
Output voltage temperature coefficient[*4]	$\dfrac{\Delta V_{OUT}}{\Delta Ta\, V_{OUT}}$	$V_{IN} = V_{OUT(S)} + 1.0$ V, $I_{OUT} = 30$ mA, -40 °C $\leq Ta \leq 85$ °C		—	± 130	—	ppm/°C	1
Current consumption during operation	I_{SS1}	$V_{IN} = V_{OUT(S)} + 1.0$ V, ON / OFF pin = ON, no load		—	60	90	μA	2
Current consumption during power-off	I_{SS2}	$V_{IN} = V_{OUT(S)} + 1.0$ V, ON / OFF pin = OFF, no load		—	0.1	1.0	μA	2
Input voltage	V_{IN}	—		2.0	—	10	V	—
ON / OFF pin input voltage "H"	V_{SH}	$V_{IN} = V_{OUT(S)} + 1.0$ V, $R_L = 1.0$ kΩ		1.5	—	—	V	4
ON / OFF pin input voltage "L"	V_{SL}	$V_{IN} = V_{OUT(S)} + 1.0$ V, $R_L = 1.0$ kΩ		—	—	0.25	V	4
ON / OFF pin input current "H"	I_{SH}	$V_{IN} = V_{OUT(S)} + 1.0$ V, $V_{ON / OFF} = 7$ V		-0.1	—	0.1	μA	4
ON / OFF pin input current "L"	I_{SL}	$V_{IN} = V_{OUT(S)} + 1.0$ V, $V_{ON / OFF} = 0$ V		-0.1	—	0.1	μA	4
Ripple rejection	$\left| RR \right|$	$V_{IN} = V_{OUT(S)} + 1.0$ V, $f = 1.0$ kHz, $\Delta V_{rip} = 0.5$ Vrms, $I_{OUT} = 50$ mA	1.2 V $\leq V_{OUT(S)} \leq 1.5$ V	—	70	—	dB	5
			1.6 V $\leq V_{OUT(S)} \leq 3.0$ V	—	65	—	dB	5
			3.1 V $\leq V_{OUT(S)} \leq 6.0$ V	—	60	—	dB	5
Short-circuit current	I_{short}	$V_{IN} = V_{OUT(S)} + 1.0$ V, ON / OFF pin = ON, $V_{OUT} = 0$ V		—	200	—	mA	3
Thermal shutdown detection temperature	T_{SD}	Junction temperature		—	150	—	°C	—
Thermal shutdown release temperature	T_{SR}	Junction temperature		—	120	—	°C	—

*1. $V_{OUT(S)}$: Set output voltage
  $V_{OUT(E)}$: Actual output voltage
      Output voltage when fixing I_{OUT} (= 100 mA) and inputting $V_{OUT(S)}$ + 1.0 V
*2. The output current at which the output voltage becomes 95% of $V_{OUT(E)}$ after gradually increasing the output current.
*3. $V_{drop} = V_{IN1} - (V_{OUT3} \times 0.98)$
  V_{OUT3} is the output voltage when $V_{IN} = V_{OUT(S)}$ + 1.0 V and I_{OUT} = 100 mA.
  V_{IN1} is the input voltage at which the output voltage becomes 98% of V_{OUT3} after gradually decreasing the input voltage.
*4. A change in the temperature of the output voltage [mV/°C] is calculated using the following equation.

$$\frac{\Delta V_{OUT}}{\Delta Ta} \; [mV/°C]^{*1} = V_{OUT(S)} \; [V]^{*2} \times \frac{\Delta V_{OUT}}{\Delta Ta \bullet V_{OUT}} \; [ppm/°C]^{*3} \div 1000$$

  *1. Change in temperature of output voltage
  *2. Set output voltage
  *3. Output voltage temperature coefficient
*5. The output current can be at least this value.
  Due to restrictions on the package power dissipation, this value may not be satisfied. Attention should be paid to the power dissipation of the package when the output current is large.
  This specification is guaranteed by design.

ABLIC Inc.

2. Types in which output voltage is externally set (S-1133B00 and S-1133A00 only)

Table 6

Thermal shutdown release temperature	T_{SR}	Junction temperature	—	120	—	°C	—

***1.** $V_{OUT(S)}$: Set output voltage (= 1.8 V)

***2.** The output current at which the output voltage becomes 95% of V_{VADJ} after gradually increasing the output current.

***3.** $V_{drop} = V_{IN1} - (V_{OUT3} \times 0.98)$

   V_{OUT3} is the output voltage when $V_{IN} = V_{OUT(S)} + 1.0$ V and $I_{OUT} = 100$ mA.

   V_{IN1} is the input voltage at which the output voltage becomes 98% of V_{OUT3} after gradually decreasing the input voltage.

***4.** A change in the temperature of the output voltage [mV/°C] is calculated using the following equation.

$$\frac{\Delta V_{OUT}}{\Delta Ta} \text{ [mV/°C]}^{*1} = V_{OUT(S)} \text{ [V]}^{*2} \times \frac{\Delta V_{OUT}}{\Delta Ta \bullet V_{OUT}} \text{ [ppm/°C]}^{*3} \div 1000$$

   ***1.** Change in temperature of output voltage

   ***2.** Set output voltage

   ***3.** Output voltage temperature coefficient

***5.** The output current can be at least this value.

   Due to restrictions on the package power dissipation, this value may not be satisfied. Attention should be paid to the power dissipation of the package when the output current is large.

   This specification is guaranteed by design.

■ Standard Circuit
*1. C_{IN} is a capacitor for stabilizing the input.
A ceramic capacitor of 2.2 μF or more can be used as the output capacitor for products whose output voltage is 1.7 V or less.
*2. A ceramic capacitor of 1.0 μF or more can be used for C_L.
A ceramic capacitor of 2.2 μF or more can be used as the output capacitor for products whose output voltage is 1.7 V or less.

Figure 17

Caution　**The above connection diagram and constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant.**

■ Condition of Application

Input capacitor (C_{IN}) :　　　　1.0 μF or more[1]
Output capacitor (C_L) :　　　　1.0 μF or more[1]
ESR of output capacitor :　　　1.0 Ω or less

*1.　2.2 μF or more for products whose output voltage is 1.7 V or less

Caution　**Generally a series regulator may cause oscillation, depending on the selection of external parts. Check that no oscillation occurs with the application using the above capacitor.**

■ Selection of Input and Output Capacitors (C_{IN}, C_L)

The S-1133 Series requires an output capacitor between the VOUT pin and the VSS pin for phase compensation. Operation is stabilized by a ceramic capacitor with an output capacitance of 1.0 μF or more[1] in the entire temperature range. When using an OS capacitor, a tantalum capacitor, or an aluminum electrolytic capacitor, the capacitance must be 1.0 μF or more, and the ESR must be 1.0 Ω or less.
The value of the output overshoot or undershoot transient response varies depending on the value of the output capacitor. Perform thorough evaluation using the actual application, including temperature characteristics.

*1.　The capacitance is 2.2 μF or more for products whose output voltage is 1.7 V or less.

■ Explanation of Terms

1. Low dropout voltage regulator

This voltage regulator has the low dropout voltage due to its built-in low on-resistance transistor.

2. Low ESR

A capacitor whose ESR (Equivalent Series Resistance) is low. The S-1133 Series enables use of a low ESR capacitor, such as a ceramic capacitor, for the output-side capacitor C_L. A capacitor whose ESR is 1.0 Ω or less can be used.

3. Output voltage (V_{OUT})

The accuracy of the output voltage is ensured at $\pm$1.0% under the specified conditions of fixed input voltage[1], fixed output current, and fixed temperature.

***1.** Differs depending on the product.

Caution **If the above conditions change, the output voltage value may vary and exceed the accuracy range of the output voltage. Please see the electrical characteristics and attached characteristics data for details.**

Remark In the types of the S-1133 Series in which the output voltage is 1.2 to 1.4 V, the output voltage accuracy is $\pm$15 mV.

4. Line regulation $\left(\dfrac{\Delta V_{OUT1}}{\Delta V_{IN} \bullet V_{OUT}}\right)$

Indicates the dependency of the output voltage on the input voltage. That is, the values show how much the output voltage changes due to a change in the input voltage with the output current remaining unchanged.

5. Load regulation (ΔV_{OUT2})

Indicates the dependency of the output voltage on the output current. That is, the values show how much the output voltage changes due to a change in the output current with the input voltage remaining unchanged.

6. Dropout voltage (V_{drop})

Indicates the difference between the input voltage (V_{IN1}) and the output voltage when; decreasing input voltage (V_{IN}) gradually until the output voltage has dropped out to the value of 98% of output voltage (V_{OUT3}), which is at V_{IN} = $V_{OUT(S)}$ + 1.0 V.

$V_{drop} = V_{IN1} - (V_{OUT3} \times 0.98)$

ABLIC Inc.

7. Output voltage temperature coefficient $\left(\dfrac{\Delta V_{OUT}}{\Delta Ta \bullet V_{OUT}}\right)$

The shaded area in **Figure 18** is the range where V_{OUT} varies in the operation temperature range when the output voltage temperature coefficient is ± 130 ppm/°C.

Example of S-1133B30 typ. product
*1. $V_{OUT(E)}$ is the value of the output voltage measured at Ta = +25°C.

Figure 18

A change in the temperature of the output voltage [mV/°C] is calculated using the following equation.

$$\frac{\Delta V_{OUT}}{\Delta Ta}\ [\text{mV/°C}]^{*1} = V_{OUT(S)}\ [\text{V}]^{*2} \times \frac{\Delta V_{OUT}}{\Delta Ta \bullet V_{OUT}}\ [\text{ppm/°C}]^{*3} \div 1000$$

*1. Change in temperature of output voltage
*2. Set output voltage
*3. Output voltage temperature coefficient

■ Operation

1. Basic operation

Figure 19 shows the block diagram of the S-1133 Series.
The error amplifier compares the reference voltage (V_{ref}) with feedback voltage (V_{fb}), which is the output voltage resistance-divided by feedback resistors (R_s and R_f). It supplies the gate voltage necessary to maintain the constant output voltage which is not influenced by the input voltage and temperature change, to the output transistor.
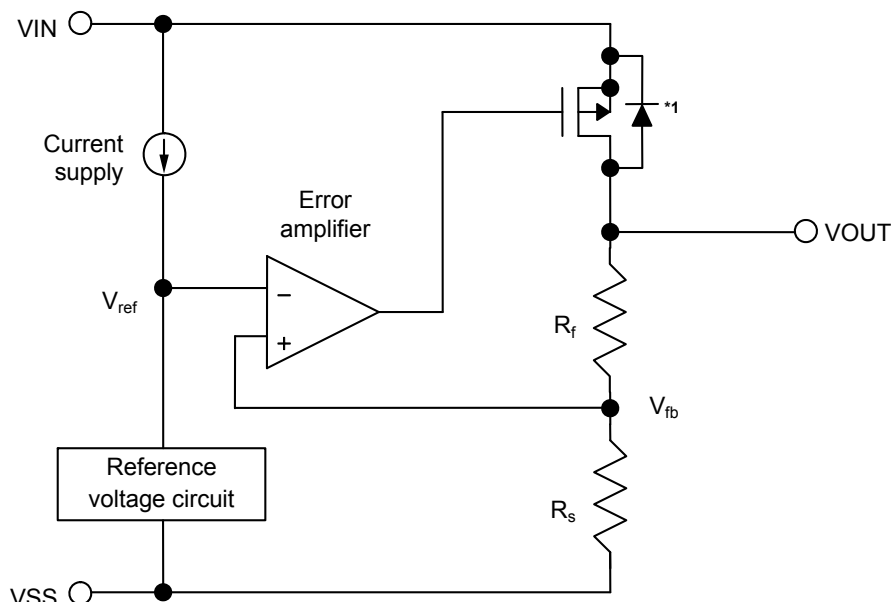

*1. Parasitic diode

Figure 19

2. Output transistor

In the S-1133 Series, a low on-resistance P-channel MOS FET is used as the output transistor.
Be sure that V_{OUT} does not exceed V_{IN} + 0.3 V to prevent the voltage regulator from being damaged due to reverse current flowing from the VOUT pin through a parasitic diode to the VIN pin, when the potential of V_{OUT} became higher than V_{IN}.

ABLIC Inc.

3. ON / OFF pin

This pin starts and stops the regulator.

When the ON / OFF pin is set to OFF level, the entire internal circuit stops operating, and the built-in P-channel MOS FET output transistor between the VIN pin and the VOUT pin is turned off, reducing current consumption significantly. The VOUT pin becomes the V_{SS} level due to the internally divided resistance of several hundreds kΩ between the VOUT pin and the VSS pin.

The structure of the ON / OFF pin is as shown in **Figure 20**. The ON / OFF pin is neither pulled down nor pulled up internally, so do not use it in the floating status. In addition, note that the current consumption increases if a voltage of 0.3 V to $V_{IN} - 0.3$ V is applied to the ON / OFF pin. When not using the ON / OFF pin, connect it to the VSS pin in the product A type, and connect it to the VIN pin in B type.

Table 7

Product Type	ON/OFF Pin	Internal Circuit	VOUT Pin Voltage	Current Consumption
A	"L": ON	Operate	Set value	I_{SS1}
A	"H": OFF	Stop	V_{SS} level	I_{SS2}
B	"L": OFF	Stop	V_{SS} level	I_{SS2}
B	"H": ON	Operate	Set value	I_{SS1}
Figure 20

4. Thermal shutdown circuit

The S-1133 Series implements a thermal shutdown circuit to protect the device from damage due to overheating. When the junction temperature rises to 150 °C typ., the thermal shutdown circuit operates and the regulator operation stops. When the junction temperature drops to 120 °C typ., the thermal shutdown circuit is released and the regulator operation resumes.

If the thermal shutdown circuit starts operating due to self-heating, the regulator operation stops and the output voltage falls. When the regulator operation has stopped, no self-heat is generated and the temperature of the IC is lowered. When the temperature has dropped, the thermal shutdown circuit is released, the regulator operation resumes, and self-heat is generated again. By repeating this procedure, the output voltage waveform forms pulses. Stop or restart of regulation continues unless decreasing either or both of the input voltage and the output current in order to reduce the internal power consumption, or decreasing the ambient temperature.

Table 8

Thermal Shutdown Circuit	VOUT Pin Voltage
Operation: 150 °C typ.[*1]	V_{SS} level
Release: 120 °C typ.[*1]	Set value

***1.** Junction temperature

5. Externally setting output voltage

The S-1133 Series provides the types in which output voltage can be set via the external resistor (S-1133B00/S-1133A00). The output voltage can be set by connecting a resistor (R_a) between the VOUT pin and the VADJ pin, and a resistor (R_b) between the VADJ pin and the VSS pin.
The output voltage is determined by the following formulas.

$V_{OUT} = 1.8 + R_a \times I_a$ ···················· (1)
By substituting $I_a = I_{VADJ} + 1.8/R_b$ to above formula (1),
$V_{OUT} = 1.8 + R_a \times (I_{VADJ} + 1.8/R_b) = 1.8 \times (1.0 + R_a/R_b) + R_a \times I_{VADJ}$ ············ (2)

In above formula (2), $R_a \times I_{VADJ}$ is a factor for the output voltage error.
Whether the output voltage error is minute is judged depending on the following (3) formula.

By substituting $I_{VADJ} = 1.8/R_{VADJ}$ to $R_a \times I_{VADJ}$
$V_{OUT} = 1.8 \times (1.0 + R_a/R_b) + 1.8 \times R_a/R_{VADJ}$ ····················(3)

If R_{VADJ} is sufficiently larger than R_a, the error is judged as minute.
Figure 21

The following expression is in order to determine output voltage V_{OUT} = 3.0 V.
If resistance R_b = 2 kΩ, substitute R_{VADJ} = 200 kΩ typ. into (3),
Resistance R_a = (3.0 / 1.8-1) × ((2 k × 200 k) / (2 k + 200 k)) ≒ 1.3 kΩ

Caution The above connection diagrams and constants will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constants.

ABLIC Inc.

■ Precautions

- Wiring patterns for the VIN pin, the VOUT pin and GND should be designed so that the impedance is low. When mounting an output capacitor between the VOUT pin and the VSS pin (C_L) and a capacitor for stabilizing the input between the VIN pin and the VSS pin (C_{IN}), the distance from the capacitors to these pins should be as short as possible.

- When setting the output voltage using the external resistor, connect the resistors, R_a between the VOUT pin and the VADJ pin and R_b between the VADJ pin and the VSS pin close to the respective pins.

- In the product that users set the output voltage externally, it is possible to set a voltage arbitrarily; by feeding back the voltage which is from the VOUT pin to the VADJ pin, after dividing it with the dividers connected between the VOUT pin and the VADJ pin, and the VADJ pin and the VSS pin.
  Note that if any device other than the divider specified above is connected between the VOUT pin and the VADJ pin or the VADJ pin and the VSS pin, S-1133 Series may not work stably as a voltage regulator IC.

- Note that generally the output voltage may increase when a series regulator is used at low load current (1.0 mA or less).

- Note that generally the output voltage may increase due to the leakage current from an output driver when a series regulator is used at high temperature.

- Generally a series regulator may cause oscillation, depending on the selection of external parts. The following conditions are recommended for the S-1133 Series. However, be sure to perform sufficient evaluation under the actual usage conditions for selection, including evaluation of temperature characteristics.

Input capacitor (C_{IN}):	1.0 μF or more[1]
Output capacitor (C_L):	1.0 μF or more[1]
Equivalent series resistance (ESR):	1.0 Ω or less

  [1]. The capacitance is 2.2 μF or more for products whose output voltage is 1.7 V or less.

- The voltage regulator may oscillate when the impedance of the power supply is high and the input capacitance is small or an input capacitor is not connected.

- If the output capacitance is small, power supply's fluctuation and the characteristics of load fluctuation become worse. Sufficiently evaluate the output voltage's fluctuation with the actual device.

- Overshoot may occur in the output voltage momentarily if the voltage is rapidly raised at power-on or when the power supply fluctuates. Sufficiently evaluate the output voltage at power-on with the actual device.

- When the thermal shutdown circuit starts operating and the regulator stops, input voltage may exceed the absolute maximum ratings.
  It will be affected largely when input voltage, output current and inductance of power supply are high.
  Perform thorough evaluation using the actual application.

- The application conditions for the input voltage, the output voltage, and the load current should not exceed the package power dissipation.

- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.

- In determining the output current, attention should be paid to the output current value specified in **Table 5** and **Table 6** in "**■ Electrical Characteristics**" and footnote **[5]** of the table.

- ABLIC Inc. claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.

※1. ランドパターンの幅に注意してください (0.25 mm min. / 0.30 mm typ.)。
※2. パッケージ中央にランドパターンを広げないでください (1.96 mm ~ 2.06 mm)。

注意　**1.** パッケージのモールド樹脂下にシルク印刷やハンダ印刷などしないでください。
　　　2. パッケージ下の配線上のソルダーレジストなどの厚みをランドパターン表面から**0.03 mm**
　　　　以下にしてください。
　　　3. マスク開口サイズと開口位置はランドパターンと合わせてください。
　　　4. 詳細は〝**SNT**パッケージ活用の手引き〟を参照してください。

※1. Pay attention to the land pattern width (0.25 mm min. / 0.30 mm typ.).
※2. Do not widen the land pattern to the center of the package (1.96 mm to 2.06mm).

Caution 1. Do not do silkscreen printing and solder printing under the mold resin of the package.
**　　　　2. The thickness of the solder resist on the wire pattern under the package should be 0.03 mm**
**　　　　　or less from the land pattern surface.**
**　　　　3. Match the mask aperture size and aperture position with the land pattern.**
**　　　　4. Refer to "SNT Package User's Guide" for details.**

※1. 请注意焊盘模式的宽度 (0.25 mm min. / 0.30 mm typ.)。
※2. 请勿向封装中间扩展焊盘模式 (1.96 mm ~ 2.06 mm)。

注意 1. 请勿在树脂型封装的下面印刷丝网、焊锡。
　　 2. 在封装下、布线上的阻焊膜厚度 (从焊盘模式表面起) 请控制在 0.03 mm 以下。
　　 3. 钢网的开口尺寸和开口位置请与焊盘模式对齐。
　　 4. 详细内容请参阅 "SNT 封装的应用指南"。
