

#### **FEATURES**

- 2 LVCMOS Outputs
- Input/Output Frequency: 1MHz to 150MHz
- Supports LVCMOS or Sine Wave Input Clock
- · Extremely low additive Jitter
- 8 mA Output Drive Strength
- Low Current Consumption
- Single 1.8V, 2.5V, or 3.3V, ±10% Power Supply
- Operating Temperature Range
  - o 0°C to 70°C (Commercial)
  - -40°C to 85°C (Industrial)
- Available in DFN-6L GREEN/RoHS Compliant Packages

#### **DESCRIPTION**

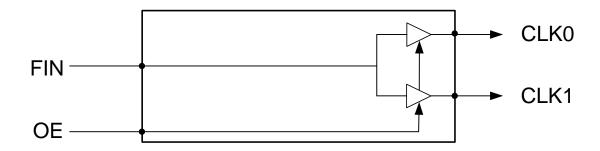

The PL133-27 is an advanced fanout buffer design for high performance, low-power, small form-factor applications. The PL133-27 accepts a reference clock input of 1MHz to 150MHz and produces two outputs of the same frequency. Reference clock inputs may be LVCMOS or sine-wave signals (the inputs are internally AC-coupled). PL133-27 is designed to fit in a small 2 x 1.3 x 0.6mm DFN package, and offers the best phase noise and jitter performance and lowest power consumption of any comparable IC.

#### PACKAGE PIN CONFIGURATION

(2.0 x 1.3 x 0.6mm)

#### **BLOCK DIAGRAM**

#### PACKAGE PIN ASSIGNMENT

Nome	Package Pin #	T	Description	
Name	DFN-6L	Type		
FIN	1	I	Reference clock input	
CLK1	2	0	Clock output	
GND	3	Р	GND connection	
CLK0	4	0	Clock output	
VDD	5	Р	V <sub>DD</sub> connection	
OE	6	I	Output enable input	

#### LAYOUT RECOMMENDATIONS

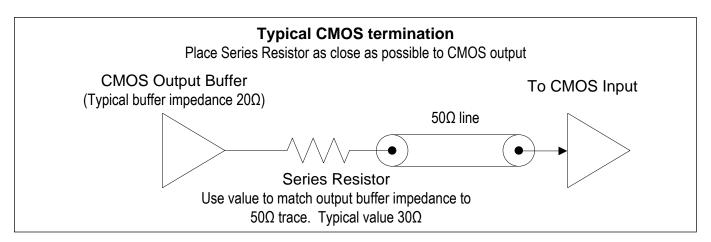

The following guidelines are to assist you with a performance optimized PCB design:

### **Signal Integrity and Termination Considerations**

- Keep traces short!
- Trace = Inductor. With a capacitive load this equals ringing!
- Long trace = Transmission Line. Without proper termination this will cause reflections (looks like ringing).
- Design long traces as "striplines" or "microstrips" with defined impedance.
- Match trace at one side to avoid reflections bouncing back and forth.

### **Decoupling and Power Supply Considerations**

- Place decoupling capacitors as close as possible to the  $V_{\text{DD}}$  pin(s) to limit noise from the power supply
- Multiple  $V_{\text{DD}}$  pins should be decoupled separately for best performance.
- Addition of a ferrite bead in series with  $V_{\text{DD}}$  can help prevent noise from other board sources
- Value of decoupling capacitor is frequency dependant. Typical values to use are  $0.1\mu F$  for designs using crystals < 50MHz and  $0.01\mu F$  for designs using crystals > 50MHz.

#### **ELECTRICAL SPECIFICATIONS**

#### **ABSOLUTE MAXIMUM RATINGS**

PARAMETERS	SYMBOL	MIN.	MAX.	UNITS
Supply Voltage Range	$V_{DD}$	-0.5	4.6	V
Input Voltage Range	VI	-0.5	V <sub>DD</sub> +0.5	V
Output Voltage Range	Vo	-0.5	V <sub>DD</sub> +0.5	V
Storage Temperature	Ts	-65	150	°C
Ambient Operating Temperature*		-40	85	°C

Exposure of the device under conditions beyond the limits specified by Maximum Ratings for extended periods may cause permanent damage to the device and affect product reliability. These conditions represent a stress rating only, and functional operations of the device at these or any other conditions above the operational limits noted in this specification is not implied. \*Operating temperature is guaranteed by design. Parts are tested to commercial grade only.

#### **AC SPECIFICATIONS**

PARAMETERS	CONDITIONS	MIN.	TYP.	MAX.	UNITS
Input (FIN) Fraguency	@ V <sub>DD</sub> = 2.5V and 3.3V	1MHz		150	MHz
Input (FIN) Frequency	@ V <sub>DD</sub> = 1.8V	IIVITZ		65	
Input (FIN) Signal Amplitude	Internally AC coupled	0.8		$V_{DD}$	$V_{PP}$
Output Rise Time	15pF Load, 10/90%V <sub>DD</sub> , 3.3V		2	3	ns
Output Fall Time	15pF Load, 90/10%V <sub>DD</sub> , 3.3V		2	3	ns
Output to Output Skew				500	ps
Duty Cycle	Input Duty Cycle is 50%	45	50	55	%

#### DC SPECIFICATIONS

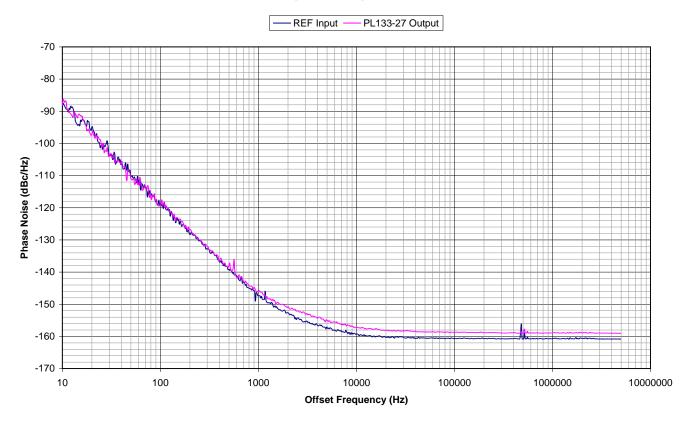

PARAMETERS	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
		V <sub>DD</sub> = 3.3V, 25MHz, No Load		1.8		mA
Supply Current, Dynamic	I <sub>DD</sub>	V <sub>DD</sub> = 2.5V, 25MHz, No Load		1.3		mA
		V <sub>DD</sub> = 1.8V, 25MHz, No Load		0.8		mA
Operating Voltage	$V_{DD}$		1.62		3.63	V
Output Low Voltage	V <sub>OL</sub>	$I_{OL} = +4mA, V_{DD} = 3.3V$			0.4	V
Output High Voltage	V <sub>OH</sub>	$I_{OH} = -4mA$ , $V_{DD} = 3.3V$	2.4			V
Output Current	I <sub>OSD</sub>	$V_{OL} = 0.4V, V_{OH} = 2.4V, V_{DD} = 3.3V$	8			mA

#### NOISE CHARACTERISTICS

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNIT
Additive Phase Jitter		V <sub>DD</sub> =3.3V, Frequency=26MHz Offset=12KHz ~ 5MHz		130		fs
		V <sub>DD</sub> =3.3V, Frequency=100MHz Offset=12KHz ~ 20MHz		150		fs

PL133-27 Additive Phase Jitter: VDD=3.3V, CLK=26MHz, Integration Range 12KHz to 5MHz: 0.127ps typical.

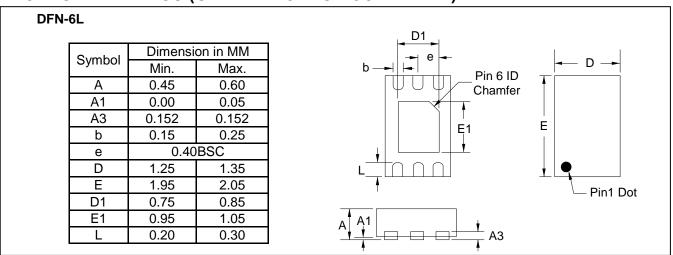

When a buffer is used to pass a signal then the buffer will add a little bit of its own noise. The phase noise on the output of the buffer will be a little bit more than the phase noise in the input signal. To quantify the noise addition in the buffer we compare the Phase Jitter numbers from the input and the output. The difference is called "Additive Phase Jitter". The formula for the Additive Phase Jitter is as follows:

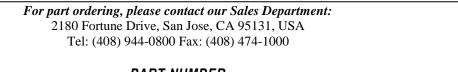

Additive Phase Jitter =  $\sqrt{\text{(Output Phase Jitter)}^2 - \text{(Input Phase Jitter)}^2}$

#### **PART NUMBER**

The order number for this device is a combination of the following: Part number, Package type and Operating temperature range

Part/Order Number	Marking	Package Option		
PL133-27GC-R	H27	6 Din DEN /Tone and Deel)		
PL133-27GI-R	LLL	6-Pin DFN (Tape and Reel)		

<sup>\*</sup>Note: LLL designates lot number
