

## DRV8833C Dual H-Bridge Motor Driver

### 1 Features

- Dual H-Bridge Motor Driver With Current Control
  - 1 or 2 DC Motors or 1 Stepper Motor
  - Low On-Resistance: HS + LS = 1735 mΩ (Typical, 25°C)
- Output Current Capability (at  $V_M = 5\text{ V}$ , 25°C)
  - PWP (HTSSOP) Package
    - 0.7-A RMS, 1-A Peak per H-Bridge
    - 1.4-A RMS in Parallel Mode
  - RTE (QFN) Package
    - 0.6-A RMS, 1-A Peak per H-Bridge
    - 1.2-A RMS in Parallel Mode
- Wide Power Supply Voltage Range
  - 2.7 to 10.8 V
- Integrated Current Regulation
- Easy Pulse-Width-Modulation (PWM) Interface
- 1.6-μA Low-Current Sleep Mode (at 5 V)
- Small Package and Footprint
  - 16 HTSSOP (PowerPAD™) 5.00 × 6.40 mm
  - 16 QFN (PowerPAD) 3.00 × 3.00 mm
- Protection Features
  - $V_M$  Undervoltage Lockout (UVLO)
  - Overcurrent Protection (OCP)
  - Thermal Shutdown (TSD)
  - Fault Indication Pin (nFAULT)

### 2 Applications

- Point-of-Sale Printers
- Video Security Cameras
- Office Automation Machines
- Gaming Machines
- Robotics
- Battery-Powered Toys

### 3 Description

The DRV8833C provides a dual-bridge motor driver solution for toys, printers, and other mechatronic applications.

The device has two H-bridges and can drive two DC brushed motors, a bipolar stepper motor, solenoids, or other inductive loads.

Each H-bridge output consists of a pair of N-channel and P-channel MOSFETs, with circuitry that regulates the winding current. With proper PCB design, each H-bridge of the DRV8833C can drive up to 700-mA RMS (or DC) continuously, at 25°C with a  $V_M$  supply of 5 V. The device can support peak currents of up to 1 A per bridge. Current capability is reduced slightly at lower  $V_M$  voltages.

Internal shutdown functions with a fault output pin are provided for overcurrent protection, short-circuit protection, UVLO, and overtemperature. A low-power sleep mode is also provided.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV8833C	HTSSOP (16)	5.00 mm × 6.40 mm
	QFN (16)	3.00 mm × 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

### Pin Functions

PIN			TYPE	DESCRIPTION	
NAME	PWP	RTE			
<b>POWER AND GROUND</b>					
GND	13	11	PWR	Device ground	Both the GND pin and device PowerPAD must be connected to ground
VINT	14	12	—	Internal regulator (3.3 V)	Internal supply voltage; bypass to GND with 2.2- $\mu$ F, 6.3-V capacitor
V <sub>M</sub>	12	10	PWR	Power supply	Connect to motor supply voltage; bypass to GND with a 10- $\mu$ F (minimum) capacitor rated for V <sub>M</sub>
<b>CONTROL</b>					
AIN1	16	14	I	H-bridge A PWM input	Controls the state of AOUT1 and AOUT2; internal pulldown
AIN2	15	13			
BIN1	9	7	I	H-bridge B PWM input	Controls the state of BOUT1 and BOUT2; internal pulldown
BIN2	10	8			
nSLEEP	1	15	I	Sleep mode input	Logic high to enable device; logic low to enter low-power sleep mode; internal pulldown
<b>STATUS</b>					
nFAULT	8	6	OD	Fault indication pin	Pulled logic low with fault condition; open-drain output requires an external pullup
<b>OUTPUT</b>					
AISEN	3	1	O	Bridge A sense	Sense resistor to GND sets PWM current regulation level (see <a href="#">PWM Motor Drivers</a> )
AOUT1	2	16	O	Bridge A output	Positive current is AOUT1 → AOUT2
AOUT2	4	2			
BISEN	6	4	O	Bridge B sense	Sense resistor to GND sets PWM current regulation level (see <a href="#">PWM Motor Drivers</a> )
BOUT1	7	5	O	Bridge B output	Positive current is BOUT1 → BOUT2
BOUT2	5	3			

### External Components

Component	Pin 1	Pin 2	Recommended
C <sub>VM</sub>	V <sub>M</sub>	GND	10- $\mu$ F <sup>(1)</sup> ceramic capacitor rated for V <sub>M</sub>
C <sub>VINT</sub>	VINT	GND	6.3-V, 2.2- $\mu$ F ceramic capacitor
R <sub>nFAULT</sub>	VINT <sup>(2)</sup>	nFAULT	>1 k $\Omega$
R <sub>AISEN</sub>	AISEN	GND	Sense resistor, see <a href="#">Typical Application</a> for sizing
R <sub>BISEN</sub>	BISEN	GND	Sense resistor, see <a href="#">Typical Application</a> for sizing

- (1) Proper bulk capacitance sizing depends on the motor power.  
 (2) nFAULT may be pulled up to an external supply rated < 5.5 V.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	Power supply (V <sub>M</sub> )	-0.3	11.8	V
	Internal regulator (VINT)	-0.3	3.8	V
	Control pins (AIN1, AIN2, BIN1, BIN2, nSLEEP, nFAULT)	-0.3	7	V
	Continuous phase node pins (AOUT1, AOUT2, BOUT1, BOUT2)	-0.3	V <sub>M</sub> + 0.5	V
	Pulsed 10 $\mu$ s phase node pins (AOUT1, AOUT2, BOUT1, BOUT2)	-1	V <sub>M</sub> + 1	V
	Continuous shunt amplifier input pins (AISEN, BISEN)	-0.3	0.5	V
	Pulsed 10 $\mu$ s shunt amplifier input pins (AISEN, BISEN)	-1	1	V
Peak drive current (AOUT1, AOUT2, BOUT1, BOUT2, AISEN, BISEN)		Internally limited		A
T <sub>J</sub>	Operating junction temperature	-40	150	$^{\circ}$ C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 Handling Ratings

		MIN	MAX	UNIT	
T <sub>stg</sub>	Storage temperature range	-65	150	$^{\circ}$ C	
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	-2000	2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	-1000	1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT	
V <sub>M</sub>	Power supply voltage range <sup>(1)</sup>	2.7	10.8	V	
V <sub>I</sub>	Logic level input voltage	0	5.5	V	
I <sub>RMS</sub>	Motor RMS current <sup>(2)</sup>	PWP package	0	0.7	A
		RTE package	0	0.6	A
f <sub>PWM</sub>	Applied PWM signal to AIN1, AIN2, BIN1, or BIN2	0	200	kHz	
T <sub>A</sub>	Operating ambient temperature	-40	85	$^{\circ}$ C	

- (1) Note that when V<sub>M</sub> is below 5 V, R<sub>DS(ON)</sub> increases and maximum output current is reduced.  
 (2) Power dissipation and thermal limits must be observed.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DRV8833C		UNIT
		HTSSOP	QFN	
		16 PINS	16 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	40.5	44.7	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	32.9	48.5	
R <sub>θJB</sub>	Junction-to-board thermal resistance	28.8	16.8	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.6	0.7	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	11.5	16.7	
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	4.8	4.2	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLIES (V<sub>M</sub>, V<sub>INT</sub>)</b>						
V <sub>M</sub>	V <sub>M</sub> operating voltage		2.7		10.8	V

### 6.6 Typical Characteristics

## 7 Detailed Description

### 7.1 Overview

The DRV8833C device is an integrated motor driver solution for brushed DC or bipolar stepper motors. The device integrates two PMOS + NMOS H-bridges and current regulation circuitry. The DRV8833C can be powered with a supply voltage from 2.7 to 10.8 V and can provide an output current up to 700 mA RMS.

A simple PWM interface allows easy interfacing to the controller circuit.

The current regulation is a 20- $\mu$ s fixed off-time slow decay.

The device includes a low-power sleep mode, which lets the system save power when not driving the motor.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 PWM Motor Drivers

The DRV8833C contains drivers for two full H-bridges. [Figure 6](#) shows a block diagram of the circuitry.

**Figure 6. H-Bridge and Current-Chopping Circuitry**

#### 7.3.2 Bridge Control and Decay Modes

The AIN1 and AIN2 input pins control the state of the AOUT1 and AOUT2 outputs; similarly, the BIN1 and BIN2 input pins control the state of the BOUT1 and BOUT2 outputs (see [Table 1](#)).

**Table 1. H-Bridge Logic**

xIN1	xIN2	xOUT1	xOUT2	FUNCTION
0	0	Z	Z	Coast / fast decay
0	1	L	H	Reverse
1	0	H	L	Forward
1	1	L	L	Brake / slow decay

The inputs can also be used for PWM control of the motor speed. When controlling a winding with PWM and the drive current is interrupted, the inductive nature of the motor requires that the current must continue to flow (called recirculation current). To handle this recirculation current, the H-bridge can operate in two different states, fast decay or slow decay. In fast-decay mode, the H-bridge is disabled and recirculation current flows through the body diodes. In slow-decay mode, the motor winding is shorted by enabling both low-side FETs.

To externally pulse-width modulate the bridge in fast-decay mode, the PWM signal is applied to one xIN pin while the other is held low; to use slow-decay mode, one xIN pin is held high. See [Table 2](#) for more information.

**Table 2. PWM Control of Motor Speed**

xIN1	xIN2	FUNCTION
PWM	0	Forward PWM, fast decay
1	PWM	Forward PWM, slow decay
0	PWM	Reverse PWM, fast decay
PWM	1	Reverse PWM, slow decay

The internal current control is still enabled when applying external PWM to xIN. To disable the current control when applying external PWM, the xISEN pins should be connected directly to ground. Figure 7 show the current paths in different drive and decay modes.

**Figure 7. Drive and Decay Modes**

**7.3.3 Current Control**

The current through the motor windings may be limited, or controlled, by a 20-μs constant off-time PWM current regulation, or current chopping. For DC motors, current control is used to limit the start-up and stall current of the motor. For stepper motors, current control is often used at all times.

When an H-bridge is enabled, current rises through the winding at a rate dependent on the DC voltage and inductance of the winding. If the current reaches the current chopping threshold, the bridge disables the current until the beginning of the next PWM cycle. Note that immediately after the output is enabled, the voltage on the xISEN pin is ignored for a fixed period of time before enabling the current sense circuitry. This blanking time is fixed at 3.75 μs.

The PWM chopping current is set by a comparator that compares the voltage across a current sense resistor connected to the xISEN pins with a reference voltage. The reference voltage, V<sub>TRIP</sub>, is fixed at 200 mV nominally.

The chopping current is calculated as in Equation 1.

$$I_{CHOP} = \frac{200 \text{ mV}}{R_{XISEN}} \tag{1}$$

Example: If a 1-Ω sense resistor is used, the chopping current will be 200 mV / 1 Ω = 200 mA.

**NOTE**

If current control is not needed, the xISEN pins should be connected directly to ground.

**7.3.4 Decay Mode**

After the chopping current threshold is reached, the H-bridge switches to slow-decay mode. This state is held for  $t_{off}$  (20  $\mu$ s) until the next cycle to turn on the high-side MOSFETs.

**7.3.5 Slow Decay**

In slow-decay mode, the high-side MOSFETs are turned off and both of the low-side MOSFETs are turned on. The motor current decreases while flowing in the two low-side MOSFETs until reaching its fixed off time (typically 20  $\mu$ s). After that, the high-side MOSFETs are enabled to increase the winding current again.

**Figure 8. Current Chopping Operation**

**7.3.6 Sleep Mode**

Driving nSLEEP low puts the device into a low-power sleep state. In this state, the H-bridges are disabled, all internal logic is reset, and all internal clocks are stopped. All inputs are ignored until nSLEEP returns inactive high. When returning from sleep mode, some time,  $t_{WAKE}$ , needs to pass before the motor driver becomes fully operational. To make the board design simple, the nSLEEP can be pulled up to the supply ( $V_M$ ). TI recommends to use a pullup resistor when this is done. This resistor limits the current to the input in case  $V_M$  is higher than 6.5 V. Internally, the nSLEEP pin has a 500-k $\Omega$  resistor to GND. It also has a clamping Zener diode that clamps the voltage at the pin at 6.5 V. Currents greater than 250  $\mu$ A can cause damage to the input structure. Therefore, TI recommends a pullup resistor between 20 to 75 k $\Omega$ .

### 7.3.7 Parallel Mode

The two H-bridges in the DRV8833C can be connected in parallel for double the current of a single H-bridge. The internal dead time in the DRV8833C prevents any risk of cross-conduction (shoot-through) between the two bridges due to timing differences between the two bridges. Figure 9 shows the connections.

**Figure 9. Parallel Mode Schematic**

### 7.3.8 Protection Circuits

The DRV8833C is fully protected against overcurrent, overtemperature, and undervoltage events.

#### 7.3.8.1 Overcurrent Protection (OCP)

An analog current limit ( $I_{OCP}$ ) circuit on each FET limits the current through the FET by limiting the gate drive. If this analog current limit persists for longer than the OCP deglitch time ( $t_{DEG}$ ), all FETs in the H-bridge are disabled and the nFAULT pin is driven low. The driver is re-enabled after the OCP retry period ( $t_{OCP}$ ) has passed. nFAULT becomes high again after the retry time. If the fault condition is still present, the cycle repeats. If the fault is no longer present, normal operation resumes and nFAULT remains deasserted. Note that only the H-bridge in which the OCP is detected will be disabled while the other bridge functions normally.

Overcurrent conditions are detected independently on both high-side and low-side devices; a short to ground, supply, or across the motor winding all result in an overcurrent shutdown. Note that overcurrent protection does not use the current sense circuitry used for PWM current control, so it functions even without presence of the xISEN resistors.

#### 7.3.8.2 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge are disabled and the nFAULT pin is driven low. After the die temperature has fallen below the specified hysteresis ( $T_{HYS}$ ), operation automatically resumes. The nFAULT pin is released after operation has resumed.

#### 7.3.8.3 UVLO

If at any time the voltage on the  $V_M$  pin falls below the UVLO threshold voltage,  $V_{UVLO}$ , all circuitry in the device is disabled, and all internal logic is reset. Operation resumes when  $V_M$  rises above the UVLO threshold. The nFAULT pin is not driven low during an undervoltage condition.

**Table 3. Device Protection**

Fault	Condition	Error Report	H-Bridge	Internal Circuits	Recovery
$V_M$ undervoltage (UVLO)	$V_M < 2.6\text{ V}$	None	Disabled	Disabled	$V_M > 2.7\text{ V}$
Overcurrent (OCP)	$I_{OUT} > I_{OCP}$	FAULTn	Disabled	Operating	OCP
Thermal Shutdown (TSD)	$T_J > T_{TSD}$	FAULTn	Disabled	Operating	$T_J < T_{TSD} - T_{HYS}$

## 7.4 Device Functional Modes

The DRV8833C is active unless the nSLEEP pin is brought logic low. In sleep mode, the H-bridge FETs are disabled (Hi-Z). Note that  $t_{SLEEP}$  must elapse after a falling edge on the nSLEEP pin before the device is in sleep mode. The DRV8833C is brought out of sleep mode automatically if nSLEEP is brought logic high. Note that  $t_{WAKE}$  must elapse before the outputs change state after wake-up.

**Table 4. Modes of Operation**

Fault	Condition	H-Bridge	Internal Circuits
Operating	nSLEEP pin high	Operating	Operating
Sleep mode	nSLEEP pin low	Disabled	Disabled
Fault encountered	Any fault condition met	Disabled	See <a href="#">Table 3</a>

## 8 Application and Implementation

### 8.1 Application Information

The DRV8833C is used in stepper or brushed DC motor control. The following design procedure can be used to configure the DRV8833C in a bipolar stepper motor application.

### 8.2 Typical Application

#### 8.2.1 Design Requirements

Table 5 gives design input parameters for system design.

**Table 5. Design Parameters**

Design Parameter	Reference	Example Value
Supply voltage	$V_M$	9 V
Motor winding resistance	$R_L$	12 $\Omega$ /phase
Motor winding inductance	$L_L$	10 mH/phase
Motor full step angle	$\theta_{\text{step}}$	1.8 $^\circ$ /step
Target stepping level	$n_m$	2 (half-stepping)
Target motor speed	$v$	120 rpm
Target chopping current	$I_{\text{CHOP}}$	200 mA
Sense resistor	$R_{\text{ISEN}}$	1 $\Omega$

#### 8.2.2 Detailed Design Procedure

##### 8.2.2.1 Stepper Motor Speed

The first step in configuring the DRV8833C requires the desired motor speed and stepping level. The DRV8833C can support full- and half-stepping modes using the PWM interface.

If the target motor speed is too high, the motor does not spin. Ensure that the motor can support the target speed.

For a desired motor speed ( $v$ ), microstepping level ( $n_m$ ), and motor full step angle ( $\theta_{\text{step}}$ ),

$$f_{\text{step}} \text{ (steps / s)} = \frac{v(\text{rpm}) \times n_m \text{ (steps)} \times 360^\circ / \text{rot}}{\theta_{\text{step}} \text{ (}^\circ / \text{step)} \times 60 \text{ s / min}} \quad (2)$$

Figure 10. Full-Step Mode

Figure 11. Half-Step Mode

### 8.2.2.2 Current Regulation

The chopping current ( $I_{CHOP}$ ) is the maximum current driven through either winding. This quantity depends on the sense resistor value ( $R_{XISEN}$ ).

$$I_{CHOP} = \frac{200 \text{ mV}}{R_{XISEN}}$$

(3)

$I_{\text{CHOP}}$  is set by a comparator which compares the voltage across  $R_{\text{XISEN}}$  to a reference voltage. Note that  $I_{\text{CHOP}}$  must follow [Equation 4](#) to avoid saturating the motor.

$$I_{\text{FS}} (\text{A}) < \frac{V_{\text{M}} (\text{V})}{R_{\text{L}} (\Omega) + R_{\text{DS(ON)}} \text{HS} (\Omega) + R_{\text{DS(ON)}} \text{LS} (\Omega)}$$

where

- $V_{\text{M}}$  is the motor supply voltage.
- $R_{\text{L}}$  is the motor winding resistance.

(4)

### 8.2.3 Application Curve

- A. Channel 1 is the AIN1 input PWM signal, and channel 2 is the AIN2 input PWM signal. BIN1 and BIN2 follow the same pattern, but are shifted by  $90^\circ$  from AIN1 and AIN2 as shown in [Figure 11](#). Channel 4 is the output current in the direction AOUT1  $\rightarrow$  AOUT2. In forward and reverse drive, the current rises until it hits the current chopping limit of 200 mA, and is regulated at that level with fixed-off time current chopping.

**Figure 12.  $\frac{1}{2}$  Stepping Operation**

## 9 Power Supply Recommendations

The DRV8833C is designed to operate from an input voltage supply ( $V_M$ ) range between 2.7 to 10.8 V. A 10- $\mu$ F ceramic capacitor rated for  $V_M$  must be placed as close to the DRV8833C as possible.

### 9.1 Sizing Bulk Capacitance for Motor Drive Systems

Bulk capacitance sizing is an important factor in motor drive system design. It depends on a variety of factors including:

- Type of power supply
- Acceptable supply voltage ripple
- Parasitic inductance in the power supply wiring
- Type of motor (brushed DC, brushless DC, stepper)
- Motor startup current
- Motor braking method

The inductance between the power supply and motor drive system limits the rate current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. Size the bulk capacitance to meet acceptable voltage ripple levels.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate-sized bulk capacitor.

Figure 13. Setup of Motor Drive System With External Power Supply

## 10 Layout

### 10.1 Layout Guidelines

Bypass the  $V_M$  terminal to GND using a low-ESR ceramic bypass capacitor with a recommended value of  $10\ \mu\text{F}$  rated for  $V_M$ . This capacitor should be placed as close to the  $V_M$  pin as possible with a thick trace or ground plane connection to the device GND pin and PowerPAD.

Bypass VINT to ground with a ceramic capacitor rated 6.3 V. Place this bypassing capacitor as close to the pin as possible.

### 10.2 Layout Example

## 11 Device and Documentation Support

### 11.1 Trademarks

PowerPAD is a trademark of Texas Instruments.

### 11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.3 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV8833CPWP	ACTIVE	HTSSOP	PWP	16	90	Green (RoHS & no Sb/Br)	NIPDAU	Level-3-260C-168 HR	-40 to 85	8833C	<a href="#">Samples</a>
DRV8833CPWPR	ACTIVE	HTSSOP	PWP	16	2000	Green (RoHS & no Sb/Br)	NIPDAU	Level-3-260C-168 HR	-40 to 85	8833C	<a href="#">Samples</a>
DRV8833CRTER	ACTIVE	WQFN	RTE	16	3000	Green (RoHS & no Sb/Br)	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	8833C	<a href="#">Samples</a>
DRV8833CRTET	ACTIVE	WQFN	RTE	16	250	Green (RoHS & no Sb/Br)	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	8833C	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

Refer to the product data sheet for package details.

# PWP0016C

# PACKAGE OUTLINE

## PowerPAD™ TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

4224559/B 01/2019

**NOTES:**

PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MO-153.
5. Features may differ or may not be present.

# EXAMPLE STENCIL DESIGN

PWP0016C

PowerPAD™ TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

STENCIL THICKNESS	SOLDER STENCIL OPENING
0.1	2.75 X 2.58
0.125	2.46 X 2.31 (SHOWN)
0.15	2.25 X 2.11
0.175	2.08 X 1.95

4224559/B 01/2019

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.

# MECHANICAL DATA

RTE (S-PWQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-leads (QFN) package configuration.
  - D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
  - E. Falls within JEDEC MO-220.

## THERMAL PAD MECHANICAL DATA

RTE (S-PWQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

4206446-8/U 08/15

NOTE: A. All linear dimensions are in millimeters

RTE (S-PWQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
