5-V Low Dropout Voltage Regulator

Automotive Power

Never stop thinking

## 1 Overview

### Features

- Exposed Pad Package with Excellent Thermal Behaviour
- Output Voltage Tolerance  $\leq \pm 2\%$
- Output Current up to 180 mA
- Very Low Standby Current Consumption
- Watchdog for Monitoring a Microprocessor
- Power-on and Undervoltage Reset with Programmable Delay Time
- Reset Low down to  $V_Q = 1\text{ V}$
- Adjustable Reset Threshold
- Very Low Dropout Voltage
- Output Current Limitation
- Reverse Polarity Protection
- Overtemperature Protection
- Wide Temperature Range from  $-40\text{ }^\circ\text{C}$  up to  $150\text{ }^\circ\text{C}$
- Input Voltage Range from  $-42\text{ V}$  to  $45\text{ V}$
- Suitable for Use in Automotive Electronics
- Green Product (RoHS compliant)
- AEC Qualified

### Description

TLE4263-2ES is a monolithic integrated very low dropout voltage regulator in a SMD package PG-DSO-8 exposed pad, especially designed for automotive applications. An input voltage up to 45 V is regulated to an output voltage of 5.0 V. The component is able to drive loads up to 180 mA. The IC is short-circuit proof by the implemented current limitation and has an integrated overtemperature shutdown.

It additionally provides features like power-on and undervoltage reset with adjustable reset threshold, a watchdog circuit for monitoring a connected microcontroller and an inhibit input for enabling or disabling the component.

The reset output RO is set to “low” in case the output voltage falls below the reset switching threshold  $V_{Q,rt}$ . This threshold can be decreased down to 3.5 V by an external resistor divider. The power-on reset delay time can be programmed by the external delay capacitor  $C_D$ .

The watchdog circuit provides a monitoring function for microcontrollers: At missing pulses on the watchdog’s input W the reset output RO is set to “low”. The trigger time for the watchdog pulses can be set by the external capacitor  $C_D$ .

The IC can be switched off by the inhibit input, reducing the current consumption to typically 0  $\mu\text{A}$ .

### Dimensioning Information on External Components

The input capacitor  $C_1$  is recommended for compensation of line influences. The output capacitor  $C_Q$  is necessary for the stability of the control loop. Stability is guaranteed at values  $\geq 22 \mu\text{F}$  and an ESR of  $\leq 3 \Omega$  within the operating temperature range. For small tolerances of the reset delay the capacitance's spread of the delay capacitor  $C_D$  and its temperature coefficient should be taken into consideration.

### Circuit Description

The control amplifier compares a reference voltage to a voltage that is proportional to the output voltage and drives the base of the series transistor via a buffer. Saturation control as a function of the load current prevents any oversaturation of the power element. The component also has a number of internal circuits for protection against:

- Overload
- Overtemperature
- Reverse polarity

In case the externally scaled down output voltage at the reset adjust input falls below 1.35 V, the external reset delay capacitor  $C_D$  is discharged by the reset generator. When the voltage of the capacitor reaches the lower threshold  $V_{DRL}$ , a reset signal occurs at the reset output and is held until the upper threshold  $V_{DU}$  is exceeded. If the reset threshold input is connected to GND, reset is triggered at an output voltage of typically 4.65 V.

#### 3.2 Pin Definitions and Functions

Pin	Symbol	Function
1	I	<b>Input</b> for compensating line influences, a capacitor to GND close to the IC terminals is recommended
2	INH	<b>Inhibit</b> enables/disables the device; connect to I if the this function is not needed
3	RO	<b>Reset Output</b> open-collector output connected to the output via an internal 30kΩ pull-up resistor; leave open if the this function is not needed
4	GND	<b>Ground</b>
5	D	<b>Reset Delay Timing</b> connect a ceramic capacitor to GND for adjusting the reset delay time / watchdog trigger time; leave open if this function is not needed
6	RADJ	<b>Reset Threshold Adjust</b> connect an external voltage divider to adjust the reset switching threshold; connect to GND for using internal threshold
7	W	<b>Watchdog</b> rising edge triggered input for monitoring a microcontroller; connect to GND if this function is not needed
8	Q	<b>Output</b> block to ground with a capacitor close to the IC terminals with a capacitance value $C \geq 22 \mu\text{F}$ , and an $\text{ESR} \leq 3 \Omega$
PAD	–	<b>Exposed Pad</b> attach the exposed pad on package bottom to the heatsink area on circuit board; connect to GND

## 6 Application Information

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.

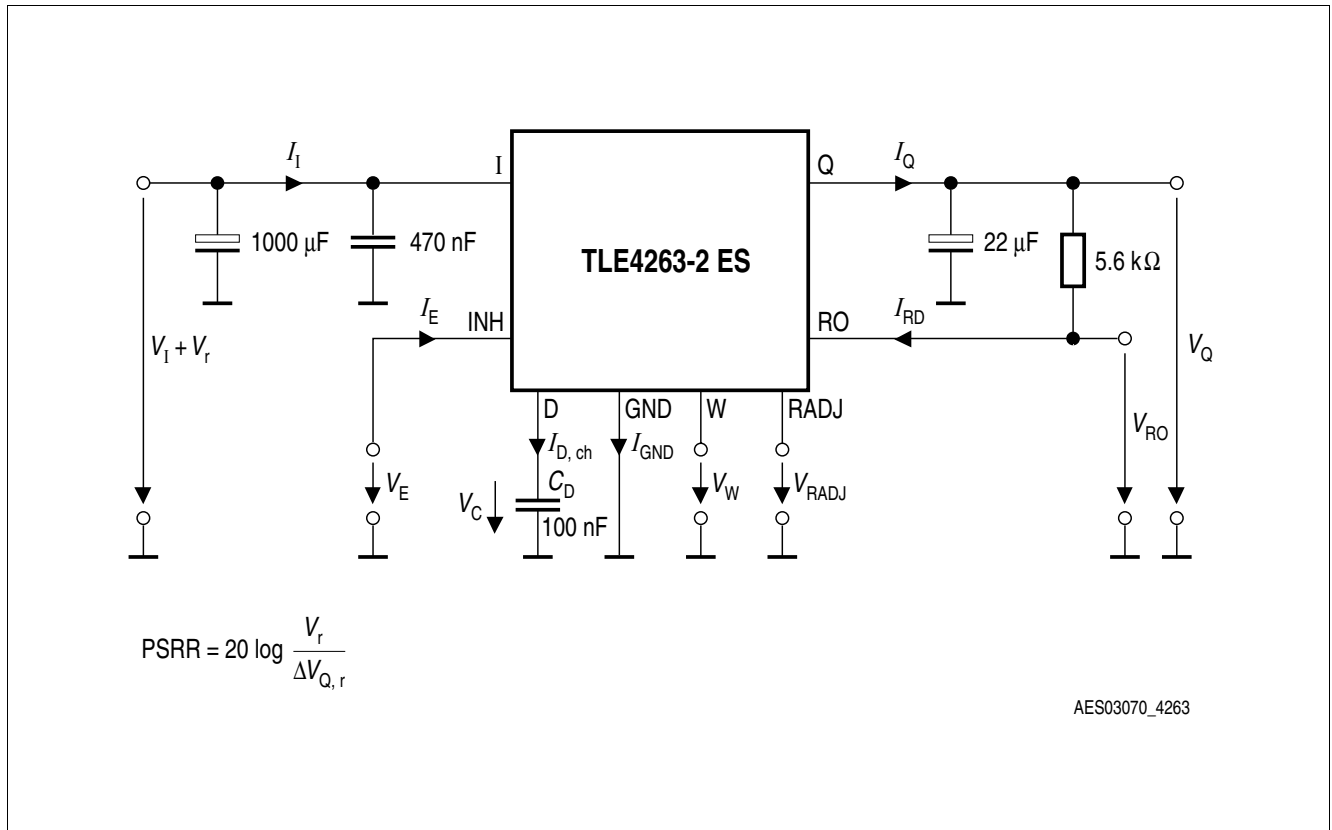

Figure 3 Application Diagram

Note: This is a very simplified example of an application circuit. The function must be verified in the real application.

## 6.1 Reset

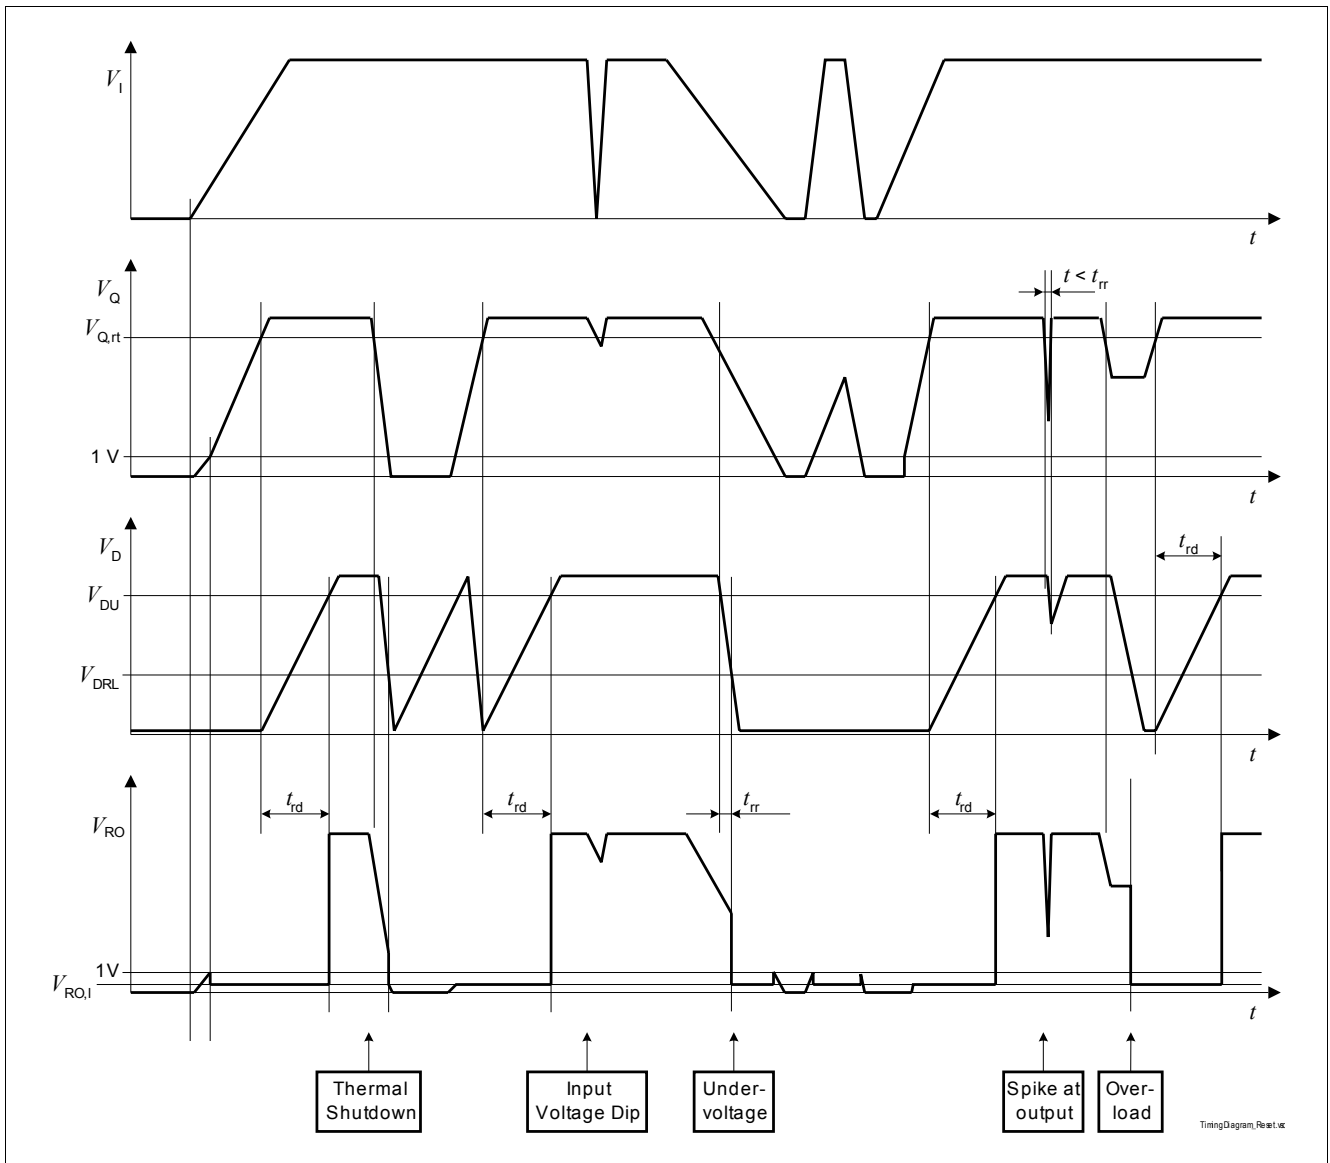

Figure 4 Reset Timing Diagram

### Power-On Reset Delay Time

If the application needs a power-on reset delay time  $t_{rd}$  different from the value given in [Item 5.7.5](#), the delay capacitor's value can be derived from these specified values and the desired power-on delay time:

$$C_D = \frac{t_{rd, new}}{t_{rd}} \times 100nF$$

with

- $C_D$ : capacitance of the delay capacitor to be chosen
- $t_{rd,new}$ : desired power-on reset delay time
- $t_{rd}$ : power-on reset delay time specified in this datasheet

For a precise calculation also take the delay capacitor's tolerance into consideration.

### Reset Adjust Function

The undervoltage reset switching threshold can be adjusted according to the application's needs by connecting an external voltage divider ( $R_{ADJ1}$ ,  $R_{ADJ2}$ ) at pin RADJ. For selecting the default threshold connect pin RADJ to GND.

When dimensioning the voltage divider, take into consideration that there will be an additional current constantly flowing through the resistors.

With a voltage divider connected, the reset switching threshold  $V_{RT,new}$  is calculated as follows:

$$V_{RT,new} = \frac{R_{ADJ,1} + R_{ADJ,2}}{R_{ADJ,2}} \times V_{RADJ,th} \quad (1)$$

with

- $V_{RT,new}$ : the desired new reset switching threshold
- $R_{ADJ1}$ ,  $R_{ADJ2}$ : resistors of the external voltage divider

$V_{RADJ,th}$ : reset adjust switching threshold given in ["Reset Function" on Page 13](#)

## 6.2 Watchdog

**Figure 5** Timing of the Watchdog Function Reset

### Watchdog Timing

The period of the watchdog pulses has to be smaller than the minimum watchdog trigger time which is set by the external reset delay capacitor  $C_D$ . Use the following formula for dimensioning  $C_D$ :

$$C_D = \frac{T_{WL,tr,new}}{T_{WL,tr}} \times 100 \text{ nF} \quad (2)$$

with

- $C_D$ : capacitance of the delay capacitor to be chosen
- $T_{WL,tr,new}$ : desired watchdog trigger time
- $T_{WL,tr}$ : watchdog trigger time specified in this data sheet
