High-Voltage, 100mA/200mA Adjustable Linear High-Brightness LED Drivers with PWM Dimming

General Description

The MAX16815/MAX16828 current regulators operate from a 6.5V to 40V input voltage range and deliver up to 100mA (MAX16815) or 200mA (MAX16828) to high-brightness LED (HB LED) loads. The output current is adjusted by using an external current-sense resistor in series with the LEDs. The MAX16815/MAX16828's dimming input allows wide-range "pulsed" PWM operation. An on-board pass element minimizes external components while providing $\pm 3.5\%$ output-current accuracy.

The MAX16815/MAX16828 are available in a thermally enhanced, $3mm \times 3mm$, 6-pin TDFN package with exposed pad and in an 8-pin SO package with exposed pad; they are specified over the automotive -40°C to +125°C temperature range.

Applications

- Emergency Vehicle Warning Lights
- Signage and Indicators
- Ambient and Architectural Lighting
- LED Bulbs
- Display Backlighting

Pin Configurations appear at end of data sheet.

Typical Operating Circuit

Features

- 6.5V to 40V Operating Range
- Adjustable LED Current MAX16815: 35mA to 100mA MAX16828: 35mA to 200mA
- ±3.5% LED Current Accuracy
- High-Voltage DIM Input for Dimming Interface
- Integrated Pass Element with Low-Dropout Voltage (0.4V typ)
- 5V Regulated Output with 4mA Source Capability
- Thermal Shutdown
- Output Short-Circuit Protection
- Available in Small, Thermally Enhanced, 3mm x 3mm, 6-Pin TDFN and 8-Pin SO with Exposed Pad Packages
- -40°C to +125°C Operating Temperature Range

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: All devices are 100% production tested at $T_A = +25$ °C. Limits over the operating temperature range are guaranteed by design.

Note 3: Resistors were added from OUT to CS+ to aid with power dissipation.

Note 4: Dropout is measured as follows:

Connect R_O from OUT to CS+. Connect R_{SENSE} = 2Ω (MAX16815) from CS+ to GND (for TDFN) or from CS+ to CS- (for SO). Set V_{IN} = 12V (record V_{OUT1} = V_{OUT}). For V_{IN} = 40V, use R_O = 360 Ω ; for V_{IN} = 6.5V, use R_O = 56 Ω . Reduce V_{IN} until V_{OUT} = 0.97 x V_{OUT1} (record as V_{IN2} and V_{OUT2}). DVDO = V_{IN2} - V_{OUT2}. Note 5: Dropout is measured as follows:

Connect R_O from OUT to CS+. Connect RSENSE = 1 Ω (MAX16828) from CS+ to GND (for TDFN) or from CS+ to CS- (for SO). Set V_{IN} = 12V (record V_{OUT1} = V_{OUT}). For V_{IN} = 40V, use R_O = 180 Ω ; for V_{IN} = 6.5V, use R_O = 27 Ω . Reduce V_{IN} until V_{OUT} = 0.97 x V_{OUT1} (record as V_{IN2} and V_{OUT2}). Δ V_{DO} = V_{IN2} - V_{OUT2}.

Note 6: I_{V5} = 0mA.

- **Note 7:** t_{ON} time includes the delay and the rise time needed for I_{OUT} to reach 90% of its final value. t_{OFF} time is the time needed for I_{OUT} to drop below 10%. See the Typical Operating Characteristics. t_{ON} and t_{OFF} are tested with 100 Ω (MAX16815) or 51 Ω (MAX16828) from OUT to CS+.
- **Note 8:** Current regulation varies with V5 load (see the *Typical Operating Characteristics*).
- **Note 9:** Thermal shutdown does not function if V5 is shorted to ground.

SO Functional Diagram

Detailed Description

+5V Regulator

The MAX16815/MAX16828 include a fixed +5V output regulator that delivers up to 4mA of load current throughout the 6.5V to 40V input voltage range. Connect a 0.1μ F compensation capacitor from V5 to ground. Shorting V5 to ground disables the thermal shutdown. V5 stays on during PWM dimming.

Thermal Protection

The MAX16815/MAX16828 enter a thermal-shutdown mode in the event of overheating. This typically occurs in overload or output short-circuit conditions. If the junction temperature exceeds $T_J = +159^{\circ}C$ (typ), the internal thermal-protection circuitry turns off the series pass device. The MAX16815/MAX16828 recover from thermal-shutdown mode once the junction temperature drops by 24°C (typ). The devices therefore protect themselves by thermal cycling in the event of a short-circuit or overload condition. Shorting V5 to ground disables the thermal shutdown.

Applications Information

Programming the LED Current

The MAX16815/MAX16828 use a sense resistor across CS+ and GND for the TDFN package or across CS+ and CS- for the SO package, to set the LED current. The LED current is given by $I_{LED} = V_{RSNS}/R_{SENSE}$.

Input-Voltage Considerations

For proper operation, the minimum input voltage must always be:

$V_{IN(MIN)} \ge V_{RSNS(MAX)} + V_{FT(MAX)} + \Delta V_{DO}(MAX)$

where $V_{FT(MAX)}$ is the total forward voltage of all series connected LEDs. The minimum operating voltage of the device is +6.5V. The device operates below +6.5V; however, output current may not meet the full regulation specification (see the *Typical Operating Characteristics*) and the V5 regulator will drop below 5V.

Low-Frequency PWM Dimming at the Output

Provide a pulse to the dimming input (DIM) of the MAX16815/MAX16828 to produce a PWM output. Alternatively, connect DIM to IN and pulse IN.

High-Voltage, 100mA/200mA Adjustable Linear High-Brightness LED Drivers with PWM Dimming

Figure 1. PWM Dimming Operation with ICM7555 Timer

Two Brightness Levels for TAIL/STOP Lights

Figure 1 shows PWM dimming operation for the MAX16815/MAX16828 with an ICM7555 timer. The ICM7555 provides adjustable duty cycle using two external resistors and a capacitor. In TAIL operation, the output of the ICM7555 feeds into DIM and lights up the LEDs. The LED's brightness depends on the duty cycle of the ICM7555. When V_{STOP} is present, DIM is pulled up to V_{STOP} . The PWM dimming operation is disabled and the LEDs light up to full brightness. See the ICM7555 data sheet for formulas to calculate the dimming frequency and the duty cycle.

LED Current Thermal Foldback

With a minimum number of external components, the MAX16815/MAX16828 provide LED current thermal foldback using a negative temperature coefficient (NTC) thermistor. Figure 2 shows a thermistor connected to V5 and the CS+ of the MAX16815/MAX16828. As the temperature increases, the voltage drop across R2 increases, causing the LED current to decrease.

 $I_{LED} = [V_{RSNS} - (R2 / R_T) (V_{V5} - V_{RSNS})]/R1$

Other Applications

The application circuit in Figure 3 implements a twolevel brightness current for TAIL/STOP lights. In TAIL operation, Q1 is off and R1 sets the output current. In

STOP operation, Q1 turns on and the output current is set by a parallel combination of R1 and R2. Figure 4 shows an application circuit with the MAX16815/ MAX16828 using a single BJT to provide high output current. For proper operation:

V_{IN(MIN)} > VCESAT(MAX) + VFT(MAX) + VRSNS

where $V_{CESAT(MAX)}$ is the maximum saturation voltage of the external BJT and $V_{FT(MAX)}$ is the total forward voltage of all series connected LEDs.
