

Introducing the PIC24F32KA304 Plug-In Module

Overview

The PIC24F32KA304 PIM is designed to demonstrate the capabilities of the PIC24F32KA304 family using the Explorer 16 Demonstration Board kit and the PICTail™ Plus Daughter Boards. [Table 1](#) and [Table 2](#) detail the pin mapping of the 44-pin device to the 100-pin PIM header.

The 44-pin to 100-pin table lists the device pins and shows what functions are mapped to each. These tables are most useful for viewing multiplexing conflicts which prevent some functions from being used simultaneously.

PIM Features

The PIC24F32KA304 44-pin device is capable of performing all of the base functions on the 100-pin Explorer 16 board. In addition, the PIM is compatible with most of the PICTail Plus Daughter Boards for the Explorer 16.

PIM Functionality

All of the built-in functionality on the Explorer 16 board can be used simultaneously, with the exception of switch, SW5, and LED10. This is because the Explorer 16 board has the LED and switch wired to the same microcontroller I/O pin. All PICTail Plus Daughter Boards work by themselves; however, most daughter boards will not work if two are installed simultaneously. Additionally, a PICTail Plus Daughter Board may not work with all of the default Explorer 16 functionality. If a PICTail Plus Daughter Board is designed to work with a Microchip stack, the stack will need to be modified to function with the PIM pinout. Please check the pinouts of the components you are using to ensure compatibility before attempting to use multiple peripheral functions or PICTail Plus Daughter Boards at the same time.

Tips for Using the PIC24F32KA

- The PIC24F32KA304 port pins are not mapped to the corresponding port I/O on the Explorer 16.
- Make sure to use the following pinout tables as a cross-reference to ensure you use the correct device pin in your application.
- Many of the peripherals used by the Explorer 16 and PICTail Plus Daughter Boards are implemented on pins with analog functionality. These peripherals may conflict with analog features on other PIC24F PIMs. Make sure to add any necessary code to override this analog functionality in your application or in the stack application you are using.
- Some Explorer 16 Boards have a 5V LCD. If you are using a function which is multiplexed onto these pins, on one of these boards, it may be necessary to manually drive the pins initially. The pin must be driven in order to ensure the bus is driven to either VDD or VSS, instead of floating at 5V.
- UART1 and SPI1 are multiplexed onto the same device pins as the temperature sensor and potentiometer on the Explorer 16 Board. Jumpers are provided to remove the analog temperature sensor and potentiometer functions from the PIM. Removing the jumpers will allow the SPI1 and UART1 to function correctly.
- Many PICTail Plus Daughter Boards use the EEPROM, SPI and UART2 (which has the RS-232 port functionality). These functions were mapped to ensure that they can be used together to allow support for these boards.
