LV5068V

Bi-CMOS IC

Low power consumption and high efficiency Step-down Switching Regulator Controller

Overview

LV5068V is 1ch step-down switching regulator. The operation current is about $80\mu A$, and low power consumption is achieved.

Functions

- 1ch SBD rectification controller IC
- Maximum value of light load mode current is 80µA.
- Built-in OCP circuit with P-by-P method
- When P-by-P is generated continuously, it shifts to the HICCUP operation.
- If connect C-HICCUP to GND pin, then latch-off when over current.
- The oscillatory frequency can be set by the external pin. The oscillatory frequency is 300 kHz to 2.2MHz
- Built-in UVLO, TSD
- Synchronous driving with external signal

Specifications

Maximum Ratings at $Ta = 25^{\circ}C$

Parameter	Symbol	Conditions	Ratings	Unit
Input voltage	V _{IN} max		45	V
Allowable pin voltage	PDR,HDRV,RSNS, ILIM,EN,PG		V _{IN}	V
	V _{IN} -PDR		6	V
	REF		6	V
	SS,FB,COMP,RT C-HICCUP,SYNC		REF	V
Allowable power dissipation	Pd max	Specified substrate *1	0.74	W
Operating temperature	Topr		-40 to +85	°C
Storage temperature	Tstg		-55 to +150	°C

*1: Specified substrate 114.3mm×76.1mm×1.6mm³ glass-epoxy

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Pin Assignment

Pin Descriptions

Pin No.	Pin name	Descriptions	Equivalent circuit
1	PG	Power good pin. Connect to open drain of MOS-FET in ICs inside. Setting output voltage to "L", when FB voltage is 1.05V or less	PG § 1kΩ GND
2	EN	ON/OFF pin	
3	ILIM	For current detection. Sink current is about 55 μ A. The current limiter comparator works when an external resistor is connected between this pin and V _{IN} , and if the voltage of this resistor is less than the voltage of RSNS then Pch MOS is turned off. This operation is reset each PWM pulse.	
4	VIN	Supply voltage pin. It is observed by the UVLO function. When its voltage becomes 3.7V or more, ICs startup in soft start.	
5	RSNS	Current detection resistor connection pin. Resistor is connected between $V_{\mbox{IN}}$ and this pin, and the current flows to MOSFET are measured.

Pin No.	Pin name	Descriptions	Equivalent circuit		
14	СОМР	Error Amplifier Output Pin. The phase compensation network is connected between GND pin and COMP pin. Thanks to current-mode control, COMP pin voltage would tell you the output current amplitude. COMP pin is connected internally to an int.comparator which comparators with 0.9V reference. If COMP pin voltage is larger than. 0.9V, IC operates in "continuous mode". If COMP pin voltage is smaller than 0.9V, IC operates in "discontinuous mode (low consumption mode)".			
15	FB	Error amplifier reverse input pin. ICs make its voltage keep 1.26V. Output voltage is divided by external resistors and it across FB.	V_{IN} $10k\Omega$ $1k\Omega$ $1k\Omega$ $1k\Omega$ 0 0 0 0
