74HC/HCT132

FEATURES

- Output capability: standard
- I_{CC} category: SSI

GENERAL DESCRIPTION

The 74HC/HCT132 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT132 contain four 2-input NAND gates which accept standard input signals. They are capable of transforming slowly changing input signals into sharply defined, jitter-free output signals.

The gate switches at different points for positive and negative-going signals. The difference between the positive voltage V_{T+} and the negative voltage V_{T-} is defined as the hysteresis voltage V_H .

QUICK REFERENCE DATA

GND = 0 V; $T_{amb} = 25 \text{ °C}$; $t_r = t_f = 6 \text{ ns}$

SYMBOL	PARAMETER	CONDITIONS	ТҮР	UNIT		
STWBOL	FARAMETER	CONDITIONS	НС	нст		
t _{PHL} / t _{PLH}	propagation delay nA, nB to nY	$C_{L} = 15 \text{ pF}; V_{CC} = 5 \text{ V}$	11	17	ns	
CI	input capacitance		3.5	3.5	pF	
C _{PD}	power dissipation capacitance per gate	notes 1 and 2	24	20	pF	

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

 $P_{D} = C_{PD} \times V_{CC}^{2} \times f_{i} + \Sigma (C_{L} \times V_{CC}^{2} \times f_{o}) \text{ where:}$

 $f_i = input frequency in MHz$

 $f_o = output frequency in MHz$

 Σ (C_L × V_{CC}² × f_o) = sum of outputs

C_L = output load capacitance in pF

 V_{CC} = supply voltage in V

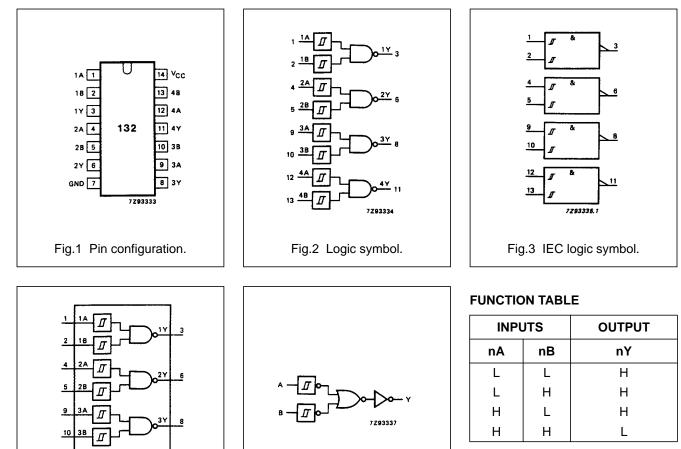

2. For HC the condition is $V_I = GND$ to V_{CC} For HCT the condition is $V_I = GND$ to $V_{CC} - 1.5$ V

ORDERING INFORMATION

See "74HC/HCT/HCU/HCMOS Logic Package Information".

PIN DESCRIPTION

PIN NO.	SYMBOL	NAME AND FUNCTION	
1, 4, 9, 12	1A to 4A	data inputs	
2, 5, 10, 13	1B to 4B	data inputs	
3, 6, 8, 11	1Y to 4Y	data outputs	
7	GND	ground (0 V)	
14	V _{CC}	positive supply voltage	

Notes

1. H = HIGH voltage level L = LOW voltage level

APPLICATIONS

- Wave and pulse shapers
- Astable multivibrators
- Monostable multivibrators

74HC/HCT132

DC CHARACTERISTICS FOR 74HCT

For the DC characteristics see "74HC/HCT/HCU/HCMOS Logic Family Specifications". Transfer characteristics are given below.

Output capability: standard I_{CC} category: SSI

Notes to HCT types

The value of additional quiescent supply current (ΔI_{CC}) for a unit load of 1 is given in the family specifications. To determine ΔI_{CC} per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
nA, nB	0.3

Transfer characteristics for 74HCT

Voltages are referenced to GND (ground = 0 V)

					T _{amb} (°	°C)				TEST CONDITIONS

Application information

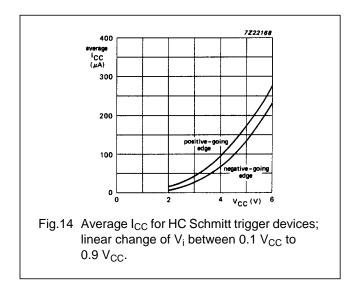

The slow input rise and fall times cause additional power dissipation, this can be calculated using the following formula:

 $\label{eq:Pad} \mathsf{P}_{ad} = \mathsf{f}_i \times (\mathsf{t}_r \times \mathsf{I}_{CCa} + \mathsf{t}_f \ \times \ \mathsf{I}_{CCa}) \times \mathsf{V}_{CC}.$

Where:

 $\begin{array}{lll} P_{ad} & = additional \ power \ dissipation \ (\mu W) \\ f_i & = input \ frequency \ (MHz) \\ t_r & = input \ rise \ time \ (ns); \ 10\% - 90\% \\ t_f & = input \ fall \ time \ (ns); \ 10\% - 90\% \\ l_{CCa} & = average \ additional \ supply \ current \ (\mu A) \end{array}$

Average I_{CCa} differs with positive or negative input transitions, as shown in Figs 14 and 15.

HC/HCT132 used in a relaxation oscillator circuit, see Fig.16.

Note to Application information

All values given are typical unless otherwise specified.

PACKAGE OUTLINES
