

MC100LVEL90

-3.3V / -5V Triple ECL Input to LVPECL Output Translator

Description

The MC100LVEL90 is a triple ECL to LVPECL translator. The device receives either -3.3 V or -5 V differential ECL signals, determined by the V_{EE} supply level, and translates them to +3.3 V differential LVPECL output signals.

To accomplish the level translation, the LVEL90 requires three power rails. The V_{CC} supply should be connected to the positive supply, and the V_{EE} pin should be connected to the negative power supply. The GND pins, as expected, are connected to the system ground plane. Both V_{EE} and V_{CC} should be bypassed to ground via 0.01 μ F capacitors.

Under open input conditions, the \bar{D} input will be biased at $V_{EE}/2$ and the D input will be pulled to V_{EE} . This condition will force the Q output to a LOW, ensuring stability.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μ F capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.
