

## LMP8640/-Q1/HV Precision High Voltage Current Sense Amplifiers

### 1 Features

- Typical Values,  $T_A = 25^\circ\text{C}$
- High Common-Mode Voltage Range
  - LMP8640: -2 V to 42 V
  - LMP8640-Q1: -2 V to 42 V, AEC-Q100
  - LMP8640HV: -2 V to 76 V
- Supply Voltage Range: 2.7 V to 12 V
- Gain Options: 20 V/V; 50 V/V; 100 V/V
- Max Gain Error: 0.25%
- Low Offset Voltage: 900  $\mu\text{V}$
- Input Bias Current: 13  $\mu\text{A}$
- PSRR: 85 dB
- CMRR (2.1V to 42V): 103 dB
- Temperature Range:  $-40^\circ\text{C}$  to  $125^\circ\text{C}$
- 6-Pin Thin SOT-23 Package

### 2 Applications

- High-Side Current Sense
- Vehicle Current Measurement
- Motor Controls
- Battery Monitoring
- Remote Sensing
- Power Management

### 3 Description

The LMP8640, LMP8640-Q1 and the LMP8640HV are precision current sense amplifiers that detect small differential voltages across a sense resistor in the presence of high input common mode voltages with a supply voltage range from 2.7 V to 12 V.

The LMP8640 and LMP8640-Q1 accept input signals with common mode voltage range from -2 V to 42 V, while the LMP8640HV accepts input signal with common mode voltage range from -2 V to 76 V. The LMP8640 and LMP8640HV have fixed gain for applications that demand accuracy over temperature. The LMP8640 and LMP8640HV come out with three different fixed gains 20 V/V, 50 V/V, 100 V/V ensuring a gain accuracy as low as 0.25%. The output is buffered in order to provide low output impedance. This high side current sense amplifier is ideal for sensing and monitoring currents in DC or battery powered systems, excellent AC and DC specifications over temperature, and keeps errors in the current sense loop to a minimum. The LMP8640 and LMP8640HV are ideal choice for industrial and consumer applications, while the LMP8640-Q1 is an AEC-Q100 grade 1 qualified version of the LMP8640 for automotive applications. The LMP8640-x is available in SOT-23-6 package.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMP8640	SOT23 (6)	2.9 mm x 1.6 mm
LMP8640-Q1		
LMP8640HV		

(1) For all available packages, see the orderable addendum at the end of the datasheet.

#### Simplified Schematic

G = 10 V/V in 20 V/V gain option  
 G = 25 V/V in 50 V/V gain option  
 G = 50 V/V in 100 V/V gain option

#### Output Voltage vs Input Voltage

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision F (April 2013) to Revision G</b>	<b>Page</b>
• New Q Device added to datasheet .....	1
• Changed data sheet flow and layout to conform with new TI standards. Added the following sections: Application and Implementation; Power Supply Recommendations; Layout; Device and Documentation Support; Mechanical, Packaging, and Ordering Information .....	1

## 5 Device Comparison Table

DEVICE NAME	GAIN	QUALIFICATIONS	MAX COMMON MODE VOLTAGE
LMP8640-T	x20		-2 V to +42 V
LMP8640-T	x20		-2 V to +42 V
LMP8640-Q1-T	x20	Automotive AEC-Q100, Grade 1	-2 V to +42 V
LMP8640-F	x50		-2 V to +42 V
LMP8640-H	x100		-2 V to +42 V
LMP8640HV-T	x20		-2 V to +76 V
LMP8640HV-F	x50		-2 V to +76 V
LMP8640HV-H	x100		-2 V to +76 V

## 6 Pin Configuration and Functions

### Pin Functions

PIN		DESCRIPTION
NUMBER	NAME	
1	$V_{OUT}$	Output
2	$V^-$	Negative Supply Voltage
3	+IN	Positive Input
4	-IN	Negative Input
5	NC	Not Internally Connected
6	$V^+$	Positive Supply Voltage

## 7 Specifications

### 7.1 Absolute Maximum Ratings<sup>(1)(2)(3)</sup>

LMP8640 limits also apply to the LMP8640-Q1.

		MIN	MAX	UNIT
Supply Voltage ( $V_S = V^+ - V^-$ )		-0.3	13.2	V
Differential Voltage +IN- (-IN)		-6	6	V
Voltage at pins +IN, -IN	LMP8640HV	-6	80	V
	LMP8640, LMP8640-Q1	-6	60	V
Voltage at $V_{OUT}$ pin		$V^-$	$V^+$	V
Junction Temperature <sup>(4)</sup>		-40	150	°C

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Operating Ratings is not implied. Operating Ratings indicate conditions at which the device is functional and the device should not be operated beyond such conditions.
- (2) For soldering specifications, see product folder at [www.ti.com](http://www.ti.com) and <http://www.ti.com/lit/SNOA549>.
- (3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (4) The maximum power dissipation must be derated at elevated temperatures and is dictated by  $T_{J(MAX)}$ ,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation  $P_{DMAX} = (T_{J(MAX)} - T_A) / \theta_{JA}$  or the number given in Absolute Maximum Ratings, whichever is lower.

### 7.2 Handling Ratings - LMP8640, LMP8640HV

		MIN	MAX	UNIT		
$T_{stg}$	Storage temperature range	-65	150	°C		
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM) <sup>(1)</sup>	For input pins +IN, -IN	-5000	5000	V
			For all other pins	-2000	2000	
		Charged device model (CDM) <sup>(2)</sup>	All pins	-1250	1250	
		Machine model (MM) <sup>(3)</sup>		-200	200	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
- (3) Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC)

### 7.3 Handling Ratings - LMP8640-Q1

		MIN	MAX	UNIT		
$T_{stg}$	Storage temperature range	-65	150	°C		
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 <sup>(1)</sup>		-2000	2000	V
		Charged device model (CDM), per AEC Q100-011	All pins	-1000	1000	
		Machine model (MM) <sup>(2)</sup>	All pins	-200	200	

- (1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.
- (2) Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC)

### 7.4 Recommended Operating Conditions<sup>(1)</sup>

		MIN	MAX	UNIT
Supply Voltage ( $V_S = V^+ - V^-$ )		2.7	12	V
Operating Junction Temperature Range <sup>(2)</sup>		-40	125	°C

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Operating Ratings is not implied. Operating Ratings indicate conditions at which the device is functional and the device should not be operated beyond such conditions.
- (2) The maximum power dissipation must be derated at elevated temperatures and is dictated by  $T_{J(MAX)}$ ,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation  $P_{DMAX} = (T_{J(MAX)} - T_A) / \theta_{JA}$  or the number given in Absolute Maximum Ratings, whichever is lower.

## 7.5 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LMP8640 LMP8640HV LMP8640-Q1	UNIT
		THIN SOT-23	
		6 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance <sup>(2)</sup>	165	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	28	
R <sub>θJB</sub>	Junction-to-board thermal resistance	24.6	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.3	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	23.8	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).  
 (2) The maximum power dissipation must be derated at elevated temperatures and is dictated by T<sub>J(MAX)</sub>, θ<sub>JA</sub>, and the ambient temperature, T<sub>A</sub>. The maximum allowable power dissipation P<sub>DMAX</sub> = (T<sub>J(MAX)</sub> - T<sub>A</sub>) / θ<sub>JA</sub> or the number given in Absolute Maximum Ratings, whichever is lower.

## 7.6 Electrical Characteristics 2.7 V<sup>(1)</sup>

Unless otherwise specified, all limits ensured for at T<sub>A</sub> = 25°C, V<sub>S</sub> = V<sup>+</sup> - V<sup>-</sup>, V<sub>SENSE</sub> = +IN - (-IN), V<sup>+</sup> = 2.7 V, V<sup>-</sup> = 0 V, -2 V < V<sub>CM</sub> < 76 V, R<sub>L</sub> = 10 MΩ. LMP8640 limits also apply to the LMP8640-Q1.

PARAMETER		TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
V <sub>OS</sub>	Input Offset Voltage	V <sub>CM</sub> = 2.1 V	-900		900	μV
		V <sub>CM</sub> = 2.1 V, Over Temperature	-1160		1160	
TCV <sub>OS</sub>	Input Offset Voltage Drift <sup>(4)</sup> <sup>(5)</sup>	V <sub>CM</sub> = 2.1 V			2.6	μV/°C
I <sub>B</sub>	Input Bias Current <sup>(6)</sup>	V <sub>CM</sub> = 2.1 V, V <sub>SENSE</sub> = 0 V		12	20	μA
		V <sub>CM</sub> = 2.1 V, Over Temperature, V <sub>SENSE</sub> = 0 V			27	
e <sub>ni</sub>	Input Voltage Noise <sup>(5)</sup>	f > 10 kHz		117		nV/√Hz
Gain A <sub>v</sub>	Gain LMP8640-T LMP8640HV-T			20		V/V
	Gain LMP8640-F LMP8640HV-F			50		
	Gain LMP8640-H LMP8640HV-H			100		
Gain error		V <sub>CM</sub> = 2.1 V	-0.25%		0.25%	
		V <sub>CM</sub> = 2.1 V, Over Temperature	-0.51%		0.51%	
Accuracy over temperature <sup>(5)</sup>		V <sub>CM</sub> = 2.1V, Over Temperature			26.2	ppm/°C
PSRR	Power Supply Rejection Ratio	V <sub>CM</sub> = 2.1 V, 2.7 V < V <sup>+</sup> < 12 V,	85			dB
CMRR	Common Mode Rejection Ratio	LMP8640HV 2.1 V < V <sub>CM</sub> < 42 V LMP8640 2.1 V < V <sub>CM</sub> < 42 V	103			dB
		LMP8640HV 2.1 V < V <sub>CM</sub> < 76 V	95			
		-2 V < V <sub>CM</sub> < 2 V,	60			

- (1) Electrical Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that T<sub>J</sub> = T<sub>A</sub>. No specification of parametric performance is indicated in the electrical tables under conditions of internal self-heating where T<sub>J</sub> > T<sub>A</sub>. Absolute Maximum Ratings indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.  
 (2) Limits are 100% production tested at 25°C. Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.  
 (3) Typical values represent the most likely parametric norm at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not ensured on shipped production material.  
 (4) Offset voltage temperature drift is determined by dividing the change in V<sub>OS</sub> at the temperature extremes by the total temperature change.  
 (5) This parameter is ensured by design and/or characterization and is not tested in production.  
 (6) Positive Bias Current corresponds to current flowing into the device. Spec does not include input signal dependent currents on the positive input of approximately V<sub>sense</sub> / 5KΩ due to topology feedback action.

## Electrical Characteristics 2.7 V <sup>(1)</sup> (continued)

Unless otherwise specified, all limits ensured for at  $T_A = 25^\circ\text{C}$ ,  $V_S = V^+ - V^-$ ,  $V_{\text{SENSE}} = +\text{IN}(-\text{IN})$ ,  $V^+ = 2.7\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $-2\text{ V} < V_{\text{CM}} < 76\text{ V}$ ,  $R_L = 10\text{ M}\Omega$ . LMP8640 limits also apply to the LMP8640-Q1.

PARAMETER		TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
BW	Fixed Gain LMP8640-T LMP8640HV-T <sup>(5)</sup>	DC $V_{\text{SENSE}} = 67.5\text{ mV}$ , $C_L = 30\text{ pF}$ , $R_L = 1\text{ M}\Omega$		950		kHz
	Fixed Gain LMP8640-F LMP8640HV-F <sup>(5)</sup>	DC $V_{\text{SENSE}} = 27\text{ mV}$ , $C_L = 30\text{ pF}$ , $R_L = 1\text{ M}\Omega$		450		
	Fixed Gain LMP8640-H LMP8640HV-H <sup>(5)</sup>	DC $V_{\text{SENSE}} = 13.5\text{ mV}$ , $C_L = 30\text{ pF}$ , $R_L = 1\text{ M}\Omega$		230

- (1) Electrical Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that  $T_J = T_A$ . No specification of parametric performance is indicated in the electrical tables under conditions of internal self-heating where  $T_J > T_A$ . Absolute Maximum Ratings indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
- (2) Limits are 100% production tested at 25°C. Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.
- (3) Typical values represent the most likely parametric norm at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (4) Offset voltage temperature drift is determined by dividing the change in V<sub>OS</sub> at the temperature extremes by the total temperature change.
- (5) This parameter is ensured by design and/or characterization and is not tested in production.
- (6) Positive Bias Current corresponds to current flowing into the device. Spec does not include input signal dependent currents on the positive input of approximately V<sub>sense</sub> / 5kΩ due to topology feedback action.
- (7) The number specified is the average of rising and falling slew rates and measured at 90% to 10%.

## 8 Detailed Description

### 8.1 Overview

The LMP8640 and LMP8640HV are single supply high side current sense amplifiers with a fixed gain of 20 V/V, 50 V/V, 100 V/V and a common mode voltage range of -2 V to 42 V (LMP8640-x) or -2 V to 76 V (LMP8640HV-x) with a buffered voltage output.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

As seen in [Figure 25](#), the current flowing through sense resistor  $R_S$  develops a voltage drop equal to  $V_{SENSE}$  across  $R_S$ . The voltage at the -IN pin will now be less than +IN by an amount proportional to the  $V_{SENSE}$  voltage.

**Figure 25. Simple Current Monitor**

The low bias currents of the error amplifier cause little voltage drop through  $R_{IN-}$ , so the negative input of the internal error amplifier is at essentially the same potential as the -IN input. The  $R_{IN}$  resistors are 5 k $\Omega$  each.

## Feature Description (continued)

The error amplifier will detect this voltage error between it's inputs and drive the MOSFET gate to conduct more current, increasing the voltage drop across  $R_{IN+}$ , until the servo amplifiers positive input matches the negative input. At this point, the voltage drop across  $R_{IN+}$  now matches  $V_{SENSE}$ .

$I_G$ , a current proportional to  $I_S$ , will flow according to the following relation:

$$I_G = V_{SENSE}/R_{IN} = R_S * I_S/R_{IN} \tag{1}$$

$I_G$  also flows through the internal gain resistor  $R_G$  developing a voltage drop equal to:

$$V_{RG} = I_G * R_G = (V_{SENSE}/R_{IN}) * R_G = ((R_S * I_S)/ R_{IN}) * R_G \tag{2}$$

$$V_{OUT} = 2*(R_S*I_S)*G, \tag{3}$$

where  $G=R_G/R_{IN} = 10 \text{ V/V}, 25 \text{ V/V}$  or  $50 \text{ V/V}$ , according to the gain option selected.

The voltage on  $R_G$  is then amplified by a gain of 2 by the output gain stage to create the final overall gain of x20, x50 and x100. The output stage has a low impedance drive allowing the LMP8640 to easily interface with other IC's (ADC, Mux,  $\mu\text{C}...$ ). No external buffering is required.

### 8.3.1 Selection of Sense Resistor

The value chosen for the shunt resistor,  $R_S$ , depends on the application. It plays a big role in a current sensing system and must be chosen with care. The selection of the shunt resistor needs to take in account the tradeoffs in small-signal accuracy, the power dissipated and the voltage loss across the shunt itself.

In applications where a small current is sensed, a bigger value of  $R_S$  is selected to minimize the error in the proportional output voltage. Higher resistor value improves the signal-to-noise ratio (SNR) at the input of the current sense amplifier and hence gives a more accurate output.

Similarly when high current is sensed, the power losses in  $R_S$  can be significant so a smaller value of  $R_S$  is desired. In this condition it is also required to take in account also the power rating of  $R_S$  resistor. The low input offset of the LMP8640 allows the use of small sense resistors to reduce power dissipation still providing a good input dynamic range. The input dynamic range is the ratio between the maximum signal that can be measured and the minimum signal that can be detected, where usually the input offset is the principal limiting factor.

**Figure 26. Example of a Kelvin (4-Wire) Connection to a Two-Terminal Resistor**

The amplifier inputs should be directly connected to the sense resistor pads using “Kelvin” or “4-wire” connection techniques. The paths of the input traces should be identical, including connectors and vias, so that these errors will be equal and cancel.

## Feature Description (continued)

### 8.3.1.1 Resistor Power Rating and Thermal Issues

The power dissipated by the sense resistor can be calculated from:

$$P_D = I_{MAX}^2 * R_S$$

where

- $P_D$  is the power dissipated by the resistor in Watts
- $I_{MAX}$  is the maximum load current in Amps
- $R_S$  is the sense resistor value in ohms.

(4)

The resistor must be rated for more than the expected maximum power ( $P_D$ ), with margin for temperature derating. Be sure to observe any power derating curves provided by the resistor manufacturer.

Running the resistor at higher temperatures will also affect the accuracy. As the resistor heats up, the resistance generally goes up, which will cause a change in the measurement. The sense resistor should have as much heat-sinking as possible to remove this heat through the use of heatsinks or large copper areas coupled to the resistor pads. A reading drifting slightly after turn-on can usually be traced back to sense resistor heating.

### 8.3.1.2 Using PCB Trace as a Sense Resistor

While it may be tempting to use the resistance of a known area of PCB trace or copper area as a sense resistor, it is not recommended for precision measurements.

The tempco of copper is typically 3300-4000ppm/°K (0.33% to 0.4% per °C), which can vary with PCB processes.

A typical surface mount sense resistor temperature coefficient (tempco) is in the 50ppm to 500ppm per °C range offering more measurement consistency and accuracy over the copper trace. Special low tempco resistors are available in the 0.1 to 50ppm range, but at a much higher cost.

### 8.3.2 Sense Line Inputs

The sense lines should be connected to a point on the resistor that is not shared with the main current path, as shown in [Figure 26](#) above. For lowest drift, the amplifier should be mounted away from any heat generating devices, which may include the sense resistor. The traces should be one continuous trace of copper from the sense resistor pad to the amplifier input pin pad, and ideally on the same copper layer with minimal vias or connectors. This can be important around the sense resistor if it is generating any significant heat gradients. Vias in the sense lines should be formed from continuous plated copper and routing through connectors should be avoided. It is better to extend the sense lines than to place the amplifier in a hostile environment.

To minimize noise pickup and thermal errors, the input traces should be treated like a high-speed differential signal pair and routed tightly together with a direct path to the input pins on the same copper layer. They do not need to be "impedance matched", but should follow the same matching rules about vias, spacing and equal lengths. The input traces should be run away from noise sources, such as digital lines, switching supplies or motor drive lines. Remember that these input traces can contain high voltage, and should have the appropriate trace routing clearances to other traces and layers. Since the sense traces only carry the amplifier bias current (typically about 12µA per input at room temp), the connecting input traces can be thin traces running close together. This can help with routing or creating the required spacings.

It should also be noted that, due to the nature of the device topology, the positive input bias current will vary with  $V_{SENSE}$  with an extra current approximately equivalent to  $V_{SENSE} / 5 \text{ k}\Omega$  on top of the typical 12 uA bias current. The negative input bias current is not in the feedback path and will not change over  $V_{SENSE}$ . High or mismatched source impedances should be avoided as this imbalance will create an additional error over input voltage.

### 8.3.3 Effects of Series Resistance on Sense Lines

Because the input stage uses precision 5 KΩ resistors internally to convert the voltage on the input pin to a current, any resistance added in series with the input pins will change this resistance, and thus alter the gain.

If a resistance is added in series with an input, the gain of that input will not track that of the other input, causing a constant gain error.

## Feature Description (continued)

It is not recommended to use external resistance to alter the gain, as external resistors will not have the same thermal matching as the internal thin film resistors. Any added resistance will severely degrade the offset and CMRR specifications. It is recommended that the total trace resistance be less than 10 ohms.

If resistors are purposely added for filtering, resistance should be added equally to both inputs and the user should be aware that the gain will change slightly.

## 8.4 Device Functional Modes

### 8.4.1 Bias Current at Low Common Mode Voltage

At common mode voltages below +2 V, the input bias current starts to reverse and crosses through zero at about +1.8 V. This can be seen in the Input Bias Current graphs in [Figure 9](#) through [Figure 11](#). Negative currents on the graph show current flow *out* of the input and *into* the load. The graphs show the current for each input, so the actual "bias" current will be twice graph value. This total current could be as high as 1 mA, depending on the point of equilibrium.

While this will not affect the vast majority of applications, it may cause MOSFET switched designs with non-linear loads (like LED's or diode-isolated loads) to "float" above ground where the load leakage and bias currents attain equilibrium. A small resistor to ground (on the load supply side) can bleed-off this current.

### 8.4.2 Applying Input Voltage with No Supply Voltage

The full specified input common mode voltage range may be applied to the inputs while the LMP8640 power is off ( $V_+ = 0$  V). When the LMP8640 is powered off, the  $R_{IN}$  resistors are disconnected internally by MOSFETS and the leakage currents are very low (sub  $\mu$ A).

The 6 V input differential limit still applies, so at no time should the two inputs be more than 6 V apart. There are also Zener clamps on the inputs to ground, so do not exceed the input limits specified in the Absolute Maximum Ratings.

### 8.4.3 Driving an ADC

The input stage of an Analog to Digital converter can be modeled with a resistor and a capacitance to ground. So if the voltage source doesn't have a low impedance, an error in amplitude measurement will occur. In this case, a buffer is needed to drive the ADC. The LMP8640 has an internal output buffer able to directly drive a capacitive load up to 30 pF, or, the input stage of an ADC. It is recommended that an external low pass RC filter be added to the output of the LMP8640 to reduce the noise and limit the bandwidth of the current sense measurement.

If the supply voltage of the LMP8640 is higher than the ADC supply voltage, care should be taken to prevent the LMP8640 output from over-driving the ADC input.

This can be accomplished with a series resistance (which should be present when driving a ADC) and a clamping diode to the ADC's power supply. The diode will clamp the ADC input to a safe level. Do not completely rely on a calculated maximum output voltage. Transients or fault conditions outside the normal conditions area can cause the output to swing to a higher than expected voltage.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The LMP8640x amplifies the voltage developed across a current-sensing resistor.

### 9.2 Typical Application

**Figure 27. Typical Application Example**

#### 9.2.1 Design Requirements

In this example, a current monitor application is required to measure the current into a load (peak current 10 A) with a resolution of 10 mA and 0.5% of accuracy.

The 10bit analog to digital converter accepts a max input voltage of 4.1 V. In order to not burn too much power on the shunt resistor, it needs to be less than 10 mΩ. [Table 1](#) below summarizes the other design conditions.

**Table 1. Example Design Requirements**

WORKING CONDITION	VALUE	
	MIN	MAX
Supply Voltage	5 V	5.5 V
Common mode Voltage	48 V	70 V
Temperature	0°C	70°C
Signal BW	50 kHz	

#### 9.2.2 Design Procedure

##### 9.2.2.1 First Step – LMP8640 or LMP8640HV Selection

The required common mode voltage of the application implies that the right choice is the LMP8640HV (High common mode voltage up to 76 V).

9.2.2.2 Second Step – Gain Option Selection

We can choose between three gain option (20 V/V, 50 V/V, 100 V/V). Considering the max input voltage of the ADC (4.1 V) , the max Sense voltage across the shunt resistor is evaluated according the following formula:

$$V_{SENSE} = (MAX\ Vin\ ADC) / Gain; \tag{5}$$

hence the max  $V_{SENSE}$  will be 205 mV, 82 mV, 41 mV respectively. The shunt resistor are then evaluated considering the maximum monitored current :

$$R_S = (max\ V_{SENSE}) / I\_MAX \tag{6}$$

For each gain option the max shunt resistors are the following : 20.5 mΩ, 8.2 mΩ, 4.1 mΩ respectively.

One of the project constraints requires  $R_S < 10\ m\Omega$ , it means that the 20.5 mΩ will be discarded and hence the 50 V/V and 100 V/V gain options are still in play.

9.2.2.3 Third Step – Shunt Resistor Selection

At this point an error budget calculation, considering the calibration of the Gain, Offset, CMRR, and PSRR, helps in the selection of the shunt resistor. In the table below the contribution of each error source is calculated considering the values of the Electrical Characteristics table at 5 V supply.

Table 2. Resolution Calculation

ERROR SOURCE	$R_S = 4.1\ m\Omega$	$R_S = 8.1\ m\Omega$
CMRR calibrated at mid VCM range	77.9 $\mu$ V	77.9 $\mu$ V
PSRR calibrated at 5 V	8.9 $\mu$ V	8.9 $\mu$ V
Total error (squared sum of contribution)	78 $\mu$ V	78 $\mu$ V
<b>Resolution</b> (Total error / $R_S$ )	19.2 mA	9.6 mA

Table 3. Accuracy Calculation

ERROR SOURCE	$R_S = 4.1\ m\Omega$	$R_S = 8.1\ m\Omega$
Tc Vos	182 $\mu$ V	182 $\mu$ V
Nosie	216 $\mu$ V	216 $\mu$ V
Gain drift	75.2 $\mu$ V	151 $\mu$ V
Total error (squared sum of contribution)	293 $\mu$ V	320 $\mu$ V
<b>Accuracy</b> $100 * (Max\_V_{SENSE} / Total\ Error)$	0.7%	0.4%

From the tables above is clear that the 8.2 mΩ shunt resistor allows the respect of the project's constraints. The power burned on the Shunt is 820 mW at 10 A.

9.2.3 Application Performance Plot

Figure 28. Application Example Results using 8.2 mΩ Resistor

### 9.3 Do's and Don'ts

Do properly bypass the power supplies.

Do add series resistance to the output when driving capacitive loads, cables, long traces, muxes and ADC inputs.

Do not exceed the input common mode range.

## 10 Power Supply Recommendations

The input circuitry of the device can accurately measure signals on common-mode voltages beyond its power supply voltage,  $V^+$ . For example, the voltage applied to the VS power supply terminal can be 5 V, whereas the load power-supply voltage being monitored (the common-mode voltage) can be as high as +76 V. Power-supply bypass capacitors are required for stability and should be placed as closely as possible to the supply and ground terminals of the device. A typical value for this supply bypass capacitor is 0.1  $\mu\text{F}$  close to the  $V^+$  pin. The capacitors should be rated for at least twice the maximum expected applied voltage. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise.

## 11 Layout

### 11.1 Layout Guidelines

- Use 4-wire (Kelvin) connections to the sense resistor. Connect to the resistor at a point that is not within a direct high-current path (See [Figure 29](#)).
- Do not "share" part of the sense trace path with the load current.
- Maintain proper clearance and spacings around the input traces, as they may be at a higher voltage (up to 76 V) than the surrounding traces and planes.
- Input traces from the sense resistor pads should follow the same path, be spaced tightly together, and ideally on the same copper layer.
- Vias used in the input traces should be of continuous plated copper to avoid creating thermocouples.
- Avoid routing inputs through jumpers and connectors. Even the best connectors introduce thermal errors ("thermocouples"). Each input trace should have the same number of "thermocouples" if they cannot be avoided.
- Keep the amplifier away from heat generating devices. The copper-solder-lead junction on the input pins will form a thermocouple. The copper mass should be equal on both input pins.
- Avoid temperature gradients across the input pins. Input pins should be equal distance to the heat source.
- Place the LMP8640 in the most temperature-stable area possible and away from high-velocity air flows. It is better to carefully extend the input traces than to place the amplifier in a less-than-ideal environment.
- Give the sense resistor as much copper trace area as possible to dissipate heat as the resistor value will change slightly with temperature. Also see the resistor manufacturers datasheet or application notes for further layout guidelines.
- The power-supply bypass capacitor should be placed as closely as possible to the supply and ground terminals. The recommended value of this bypass capacitor is 0.1  $\mu\text{F}$ . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

LMP8640QMKX-T/NOPB	ACTIVE	SOT-23-THIN	DDC	6	3000	RoHS & Green	Call TI   NIPDAU	Level-1-260C-UNLIM	-40 to 125	AUAA	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF LMP8640, LMP8640-Q1 :**

- Catalog : [LMP8640](#)
- Automotive : [LMP8640-Q1](#)

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product
- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

LMP8640QMKX-T/NOPB	SOT-23-THIN	DDC	6	3000	208.0	191.0	35.0

4214841/C 04/2022

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC MO-193.

# EXAMPLE BOARD LAYOUT

DDC0006A

SOT-23 - 1.1 max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE  
EXPLODED METAL SHOWN  
SCALE:15X

SOLDEMASK DETAILS

4214841/C 04/2022

NOTES: (continued)

- 4. Publication IPC-7351 may have alternate designs.
- 5. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

DDC0006A

SOT-23 - 1.1 max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE  
BASED ON 0.125 THICK STENCIL  
SCALE:15X

4214841/C 04/2022

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
7. Board assembly site may have different recommendations for stencil design.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
