

MIC2546/2547

Dual Programmable Current Limit Switch

General Description

The MIC2546 and MIC2547 are integrated high-side dual power switches optimized for low loss dc power switching and other power management applications, including Advanced Configuration and Power Interface (ACPI). The MIC2546/47 is a cost-effective, highly integrated solution that requires few external components to satisfy USB and ACPI requirements.

Load current management features include a precision resistor-programmable output current-limit and a soft-start circuit which minimizes inrush current when the switch is enabled. Thermal shutdown, along with current-limit, protects the switch and the attached device.

The MIC2546/47's open-drain flag outputs are used to indicate current-limiting or thermal shutdown to a local controller. The MIC2547 has an additional internal latch which turns the output off upon thermal shutdown providing robust fault control. The enable signal is compatible with both 3V and 5V logic, and is also used as the thermal shutdown latch reset for the MIC2547.

The MIC2546 and MIC2547 are available in active-high and active-low enable versions in 16-pin TSSOP and SOP packages.

Data sheets and support documentation can be found on Micrel's web site at www.micrel.com.

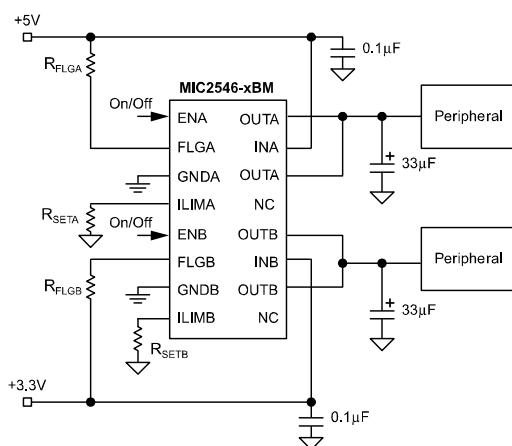

Features

- 2.7V to 5.5V input
- Adjustable current-limit up to 1.5A
- Reverse current flow blocking (no "body diode")
- 100µA typical on-state supply current per channel
- 2µA typical off-state supply current
- 120mΩ maximum on-resistance
- Open-drain fault flag
- Thermal shutdown
- Thermal shutdown output latch (MIC2547)
- 2ms (slow) turn-on and fast turnoff
- Available with active-high or active-low enable

Applications

- USB power distribution
- PCI Bus Power Switching
- Notebook PC
- ACPI power distribution
- PC card hot swap applications
- Inrush current-limiting
- Ideal for dual supply applications

Typical Application

Typical Advanced Configuration and Power Interface (ACPI) Application

UL Recognized Component

Pin Description

Pin Number	Pin Name	Pin Function
1	INA	Input A: Output A MOSFET drain. Also supplies internal circuitry.
2, 16	OUTA	Switch A (Output): Output A MOSFET source. Pins 2 and 16 must be externally connected.
3	ENA	Enable A (Input): Logic-compatible enable input. Active-activelow (-2). High input >1.7V typical; low input <1.5V typical. MIC2547 only: Also resets thermal shutdown latch.
4, 10	NC	Not internally connected.
5	FLGA	Fault Flag A (Output): Active-low, open-drain output. Indicates overcurrent or thermal shutdown conditions. MIC2547 only: latched low on thermal shutdown.
6, 14	GNDB, GNDA	Ground. Both pins must be connected to GND.
7	ILIMB	Current Limit Channel B: Sets current-limit threshold using an resistor, R _{SET} , connected to ground. $154\Omega < R_{SET} < 2.29k\Omega$.
8, 11	OUTB	Switch B (Output): Pins 8 and 11 must be externally connected.
9	INB	Input B
12	ENB	Enable B (Input)
13	FLGB	Fault Flag B (Output)
15	ILIMA	Fault Flag B (Output)

Absolute Maximum Ratings⁽¹⁾

Notes:

Note 1. Exceeding the absolute maximum rating may damage the device.

Note 2. The device is not guaranteed to function outside its operating rating.

Note 3. Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5k in series with 100pF.

Note 4. Off is " 0.8V and on is ≥ 2.4V for the MIC2546-1 and MIC2547-1. Off is ≥ 2.4V and on is " 0.8V for the MIC2546-2 and MIC2547-2. The enable input has about 200mV of hysteresis.

Note 5. Guaranteed by design, but not production tested.

Note 6. Current limit threshold is determined by: $I_{LIMIT} = \frac{230V}{R_{SET}}$, where R_{SET} is in ohms.

Functional Description

The MIC2546 and MIC2547 are dual high-side N-channel switches available with active-high or active-low enable inputs. Fault conditions turn off or inhibit turn-on of the output transistor and activate the open-drain error flag transistor making it sink current to ground.

Input and Output

INX is the power supply connection to the logic circuitry and the drain of the output MOSFET. OUTX is the source of the output MOSFET. In a typical circuit, current flows from INX to OUTX toward the load. If VOUT is greater than VIN, current will flow from OUTX to INX since the switch is bidirectional when enabled. The output MOSFET and driver circuitry are also designed to allow the MOSFET source to be externally forced to a higher voltage than the drain (VOUT > VIN) when the switch is disabled. In this situation, the MIC2546/47 avoids undesirable current flow from OUTX to INX. Both OUT pins for a given channel must be connected together.

Thermal Shutdown

Thermal shutdown shuts off the output MOSFET and signals the fault flag if the die temperature exceeds 140°C. 10°C of hysteresis prevents the switch from turning on until the die temperature drops to 130°C. Overtemperature detection functions only when the switch is enabled.

The MIC2547 features an internal latch which causes the part to remain off after thermal shutdown until a reset pulse is provided via the enable pin. While in current-limit, the thermal shutdown latch prevents on/off cycling of the output. Refer to Figure 2 for timing diagram. The flag remains low until reset.

Enable Input

ENX must be driven logic high or logic low, or be pulled high or low for a clearly defined input. Floating the input may cause unpredictable operation. ENX should not be allowed to go negative with respect to GND, and VENX should be less than or equal to VINX.

Adjustable Current-Limit

The short-circuit current-limit is user-adjustable with an external set resistor. Current-limit in the range of 100mA to 1.5A is available with a set point accuracy of better than ±20%. The current-limit circuit prevents damage to the output MOSFET and external load.

The nominal current-limit value is set with an external resistor between ILIMX and GND. For a desired current-limit, the value of the external set resistor is given by:

$$R_{SETX} = \left(\frac{230V}{I_{LIMITX}} \right)$$

where:

$$154\Omega < R_{SET} < 2.29k\Omega$$

For example, to set a 1A nominal current-limit, RSET is calculated as:

$$\left(\frac{230V}{1A} \right) = 230\Omega$$

Current through RSETX increases with OUT current. The voltage across RSETX could be monitored with a high impedance comparator to provide an indication of output current. RSETX should be between 154Ω and 2.29kΩ (0.5% resistor value).

Short-Circuit Protection

In the event of a short-circuit, the output current will fold back to approximately 80% of the short-circuit current-limit.

Fault Flag

FLGX is an N-channel, open-drain MOSFET output. The fault-flag is active (low) for current-limit or thermal shutdown conditions. The flag output MOSFET is capable of sinking a 10mA load to typically 100mV above ground.

Application Information

Supply Filtering

A 0.1µF to 1µF bypass capacitor from INX to GND, located near the MIC2546 and MIC2547, is strongly recommended to control supply transients. Without a bypass capacitor, an output short may cause sufficient ringing on the input (from supply lead inductance) to damage internal control circuitry.

Input transients must not exceed the absolute maximum supply voltage ($V_{IN\ max} = 6V$) even for a short duration.

Supply Bypassing

Power Dissipation

The device's junction temperature depends on several factors such as the load, PCB layout, ambient temperature and package type. Equations that can be used to calculate power dissipation and junction temperature are found below.

Calculation of power dissipation can be accomplished by the following equation:

$$P_D = R_{DS(ON)} \times (I_{OUT})^2$$

To relate this to junction temperature, the following equation can be used:

$$T_J = P_D \times \theta_{JA} + T_A$$

where:

T_J = junction temperature

T_A = ambient temperature

θ_{JA} = is the thermal resistance of the package

Transient Overcurrent Filter

The inrush current from the connection of a heavy capacitive load may cause the fault flag to fall for 10µs to 200µs while the switch is in a constant-current mode, charging the capacitance.

Adding an optional series resistor-capacitor (R_{SET2}) in parallel with R_{SET1} , as shown in Figure 3, allows the transient current-limit to be set to a different value than steady state. A typical USB hot-plug inrush is 2A to 3A for 10µs to 20µs. If R_{SET1} is 435Ω (510mA), an R_{SET2} of 88Ω (2.5A) and C_{SET} of µF ($RC = 100\mu s$) allows transient surge of 3A to pass for 100µs without tripping the overcurrent flag (FLG).

USB Power Distribution

The MIC2546 is ideal for meeting USB power distribution requirements. Figure 3 depicts a USB Host application. RSET should be set to a value providing a current-limit >500mA. The accurate current-limit of the MIC2546 will reduce power supply current requirements. Also, fast reaction to short circuit faults prevent voltage droop in mobile PC applications.

Printed Circuit Board Hot-Plug

The MIC2546/47 are ideal inrush current-limiters suitable for hot-plug applications. Due to the integrated charge pump, the MIC2546/47 presents a high impedance when off and slowly becomes a low impedance as it turns on. This "softstart" feature effectively isolates power supplies from highly capacitive loads by reducing inrush current during hot-plug events.
