

LM4752 Stereo 11W Audio Power Amplifier

Check for Samples: [LM4752](#)

FEATURES

- Drives 4Ω and 8Ω Loads
- Internal Gain Resistors ($A_V = 34$ dB)
- Minimum External Component Requirement
- Single Supply Operation
- Internal Current Limiting
- Internal Thermal Protection
- Compact 7-lead TO-220 Package
- Low Cost-Per-Watt
- Wide Supply Range 9V - 40V

APPLICATIONS

- Compact Stereos
- Stereo TVs
- Mini Component Stereos
- Multimedia Speakers

KEY SPECIFICATIONS

- Output Power at 10% THD+N with 1kHz into 4Ω
 $V_{CC} = 24V$ 11 W (typ)
- Output Power at 10% THD+N with 1kHz into 8Ω
 $V_{CC} = 24V$ 7 W (typ)
- Closed Loop Gain 34 dB (typ)
- P_O at 10% THD+N @ 1 kHz into 4Ω Single-Ended DDPACK Package $V_{CC} = 12V$ 2.5 W (typ)
- P_O at 10% THD+N @ 1kHz into 8Ω Bridged DDPACK Package $V_{CC} = 12V$ 5 W (typ)

DESCRIPTION

The LM4752 is a stereo audio amplifier capable of delivering 11W per channel of continuous average output power to a 4Ω load, or 7W per channel into 8Ω using a single 24V supply at 10% THD+N.

The LM4752 is specifically designed for single supply operation and a low external component count. The gain and bias resistors are integrated on chip, resulting in a 11W stereo amplifier in a compact 7 pin TO-220 package. High output power levels at both 20V and 24V supplies and low external component count offer high value for compact stereo and TV applications. A simple mute function can be implemented with the addition of a few external components.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Plastic Package (Top View)
See Package Number NDZ

7 Pin DDPACK Package (Top View)
See Package Number KTW

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾⁽²⁾⁽³⁾

Supply Voltage		40V
Input Voltage		±0.7V
Input Voltage at Output Pins ⁽⁴⁾		GND – 0.4V
Output Current		Internally Limited
Power Dissipation ⁽⁵⁾		62.5W
ESD Susceptibility ⁽⁶⁾		2 kV
Junction Temperature		150°C
Soldering Information	NDZ Package (10 sec)	250°C
Storage Temperature		–40°C to 150°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not ensure specific performance limits. Electrical Characteristics state DC and AC electrical specifications under particular test conditions which ensure specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are not ensured for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) All voltages are measured with respect to the GND pin (4), unless otherwise specified.
- (4) The outputs of the LM4752 cannot be driven externally in any mode with a voltage lower than -0.4V below GND or permanent damage to the LM4752 will result.
- (5) For operating at case temperatures above 25°C, the device must be derated based on a 150°C maximum junction temperature and a thermal resistance of $\theta_{JC} = 2^{\circ}\text{C}/\text{W}$ (junction to case). Refer to the section [DETERMINING MAXIMUM POWER DISSIPATION](#) for more information.
- (6) Human body model, 100 pF discharged through a 1.5 k Ω resistor.

OPERATING RATINGS

Temperature Range $T_{MIN} \leq T_A \leq T_{MAX}$	$-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$
Supply Voltage	9V to 32V
θ_{JC}	$2^{\circ}\text{C}/\text{W}$
θ_{JA}	$79^{\circ}\text{C}/\text{W}$

ELECTRICAL CHARACTERISTICS

The following specifications apply to each channel with $V_{CC} = 24\text{V}$, $T_A = 25^{\circ}\text{C}$ unless otherwise specified.

Symbol	Parameter	Conditions	LM4752		Units (Limits)
			Typical ⁽¹⁾	Limit ⁽²⁾	
I_{total}	Total Quiescent Power Supply Current	$V_{INAC} = 0\text{V}$, $V_o = 0\text{V}$, $R_L = \infty$	10.5	20	mA(max)
				7	mA(min)
P_o	Output Power (Continuous Average per Channel)	$f = 1\text{ kHz}$, THD+N = 10%, $R_L = 8\Omega$	7	10	W
		$f = 1\text{ kHz}$, THD+N = 10%, $R_L = 4\Omega$			W(min)
		$V_{CC} = 20\text{V}$, $R_L = 8\Omega$	4	W	
		$V_{CC} = 20\text{V}$, $R_L = 4\Omega$	7	W	
		$f = 1\text{ kHz}$, THD+N = 10%, $R_L = 4\Omega$ $V_S = 12\text{V}$, DDPACK Pkg.	2.5	W	
THD+N	Total Harmonic Distortion plus Noise	$f = 1\text{ kHz}$, $P_o = 1\text{ W/ch}$, $R_L = 8\Omega$	0.08		%
V_{OSW}	Output Swing	$R_L = 8\Omega$, $V_{CC} = 20\text{V}$	15		V
		$R_L = 4\Omega$, $V_{CC} = 20\text{V}$	14		V
X_{talk}	Channel Separation	See Figure 1 $f = 1\text{ kHz}$, $V_o = 4\text{ V}_{rms}$, $R_L = 8\Omega$	55		dB
PSRR	Power Supply Rejection Ratio	See Figure 1 $V_{CC} = 22\text{V}$ to 26V , $R_L = 8\Omega$	50		dB
V_{ODV}	Differential DC Output Offset Voltage	$V_{INAC} = 0\text{V}$	0.09	0.4	V(max)
SR	Slew Rate		2		V/ μs
R_{IN}	Input Impedance		83		k Ω
PBW	Power Bandwidth	3 dB BW at $P_o = 2.5\text{W}$, $R_L = 8\Omega$	65		kHz
A_{VCL}	Closed Loop Gain (Internally Set)	$R_L = 8\Omega$	34	33	dB(min)
				35	dB(max)
e_{in}	Noise	IHF-A Weighting Filter, $R_L = 8\Omega$ Output Referred	0.2		mVrms
I_o	Output Short Circuit Current Limit	$V_{IN} = 0.5\text{V}$, $R_L = 2\Omega$		2	A(min)

(1) Typicals are measured at 25°C and represent the parametric norm.

(2) Limits ensure that all parts tested in production meet the stated values.

APPLICATION INFORMATION

CAPACITOR SELECTION AND FREQUENCY RESPONSE

With the LM4752, as in all single supply amplifiers, AC coupling capacitors are used to isolate the DC voltage present at the inputs (pins 2,6) and outputs (pins 1,7). As mentioned earlier in the [EXTERNAL COMPONENTS DESCRIPTION](#) section these capacitors create high-pass filters with their corresponding input/output impedances. The Typical Application Circuit shown in [Figure 1](#) shows input and output capacitors of 0.1 μF and 1,000 μF respectively. At the input, with an 83 k Ω typical input resistance, the result is a high pass 3 dB point occurring at 19 Hz. There is another high pass filter at 39.8 Hz created with the output load resistance of 4 Ω . Careful selection of these components is necessary to ensure that the desired frequency response is obtained. The Frequency Response curves in the [TYPICAL PERFORMANCE CHARACTERISTICS](#) section show how different output coupling capacitors affect the low frequency rolloff.

APPLICATION CIRCUIT WITH MUTE

With the addition of a few external components, a simple mute circuit can be implemented, such as the one shown in [Figure 3](#). This circuit works by externally pulling down the half supply bias line (pin 5), effectively shutting down the input stage.

When using an external circuit to pull down the bias, care must be taken to ensure that this line is not pulled down too quickly, or output “pops” or signal feedthrough may result. If the bias line is pulled down too quickly, currents induced in the internal bias resistors will cause a momentary DC voltage to appear across the inputs of each amplifier's internal differential pair, resulting in an output DC shift towards V_{SUPPLY} . An R-C timing circuit should be used to limit the pull-down time such that output “pops” and signal feedthroughs will be minimized. The pull-down timing is a function of a number of factors, including the external mute circuitry, the voltage used to activate the mute, the bias capacitor, the half-supply voltage, and internal resistances used in the half-supply generator. [Table 1](#) shows a list of recommended values for the external mute circuitry.

Table 1. Values for Mute Circuit

V_{MUTE}	R1	R2	C1	R3	C_{B}	V_{CC}
5V	10 k Ω	10 k Ω	4.7 μF	360 Ω	100 μF	21V–32V
V_{S}	20 k Ω	1.2 k Ω	4.7 μF	180 Ω	100 μF	15V–32V
V_{S}	20 k Ω	910 Ω	4.7 μF	180 Ω	47 μF	22V–32V

OPERATING IN BRIDGE-MODE

Though designed for use as a single-ended amplifier, the LM4752 can be used to drive a load differentially (bridge-mode). Due to the low pin count of the package, only the non-inverting inputs are available. An inverted signal must be provided to one of the inputs. This can easily be done with the use of an inexpensive op-amp configured as a standard inverting amplifier. An LF353 is a good low-cost choice. Care must be taken, however, for a bridge-mode amplifier must theoretically dissipate four times the power of a single-ended type. The load seen by each amplifier is effectively half that of the actual load being used, thus an amplifier designed to drive a 4 Ω load in single-ended mode should drive an 8 Ω load when operating in bridge-mode.

Figure 44. Bridge-Mode Application

Figure 45. THD+N vs. P_{OUT} for Bridge-Mode Application

PREVENTING OSCILLATIONS

With the integration of the feedback and bias resistors on-chip, the LM4752 fits into a very compact package. However, due to the close proximity of the non-inverting input pins to the corresponding output pins, the inputs should be AC terminated at all times. If the inputs are left floating, the amplifier will have a positive feedback path through high impedance coupling, resulting in a high frequency oscillation. In most applications, this termination is typically provided by the previous stage's source impedance. If the application will require an external signal, the inputs should be terminated to ground with a resistance of 50 kΩ or less on the AC side of the input coupling capacitors.

UNDERVOLTAGE SHUTDOWN

If the power supply voltage drops below the minimum operating supply voltage, the internal under-voltage detection circuitry pulls down the half-supply bias line, shutting down the preamp section of the LM4752. Due to the wide operating supply range of the LM4752, the threshold is set to just under 9V. There may be certain applications where a higher threshold voltage is desired. One example is a design requiring a high operating supply voltage, with large supply and bias capacitors, and there is little or no other circuitry connected to the main power supply rail. In this circuit, when the power is disconnected, the supply and bias capacitors will discharge at a slower rate, possibly resulting in audible output distortion as the decaying voltage begins to clip the output signal. An external circuit may be used to sense for the desired threshold, and pull the bias line (pin5) to ground to disable the input preamp. Figure 46 shows an example of such a circuit. When the voltage across the zener diode drops below its threshold, current flow into the base of Q1 is interrupted. Q2 then turns on, discharging the bias capacitor. This discharge rate is governed by several factors, including the bias capacitor value, the bias voltage, and the resistor at the emitter of Q2. An equation for approximating the value of the emitter discharge resistor, R, is given below:

$$R = (0.7V) / (C_B \cdot (V_S / 2) / 0.1s) \quad (1)$$

Note that this is only a linearized approximation based on a discharge time of 0.1s. The circuit should be evaluated and adjusted for each application.

As mentioned earlier in the [Application Circuit with Mute](#) section, when using an external circuit to pull down the bias line, the rate of discharge will have an effect on the turn-off induced distortions. Please refer to the [Application Circuit with Mute](#) section for more information.

Figure 46. External Undervoltage Pull-Down

THERMAL CONSIDERATIONS

HEAT SINKING

Proper heatsinking is necessary to ensure that the amplifier will function correctly under all operating conditions. A heatsink that is too small will cause the die to heat excessively and will result in a degraded output signal as the internal thermal protection circuitry begins to operate.

The choice of a heatsink for a given application is dictated by several factors: the maximum power the IC needs to dissipate, the worst-case ambient temperature of the circuit, the junction-to-case thermal resistance, and the maximum junction temperature of the IC. The heat flow approximation equation used in determining the correct heatsink maximum thermal resistance is given below:

$$T_J - T_A = P_{DMAX} \cdot (\theta_{JC} + \theta_{CS} + \theta_{SA})$$

where

- P_{DMAX} = maximum power dissipation of the IC
- T_J (°C) = junction temperature of the IC
- T_A (°C) = ambient temperature
- θ_{JC} (°C/W) = junction-to-case thermal resistance of the IC
- θ_{CS} (°C/W) = case-to-heatsink thermal resistance (typically 0.2 to 0.5 °C/W)
- θ_{SA} (°C/W) = thermal resistance of heatsink

(2)

When determining the proper heatsink, the above equation should be re-written as:

$$\theta_{SA} \leq [(T_J - T_A) / P_{DMAX}] - \theta_{JC} - \theta_{CS} \quad (3)$$

DDPAK HEATSINKING

Surface mount applications will be limited by the thermal dissipation properties of printed circuit board area. The DDPACK package is not recommended for surface mount applications with $V_S > 16V$ due to limited printed circuit board area. There are DDPACK package enhancements, such as clip-on heatsinks and heatsinks with adhesives, that can be used to improve performance.

Standard FR-4 single-sided copper clad will have an approximate Thermal resistance (θ_{SA}) ranging from:

1.5 × 1.5 in. sq.	20–27°C/W	($T_A=28^\circ\text{C}$, Sine wave testing, 1 oz. Copper)
2 × 2 in. sq.	16–23°C/W	

The above values for θ_{SA} vary widely due to dimensional proportions (i.e. variations in width and length will vary θ_{SA}).

For audio applications, where peak power levels are short in duration, this part will perform satisfactory with less heatsinking/copper clad area. As with any high power design proper bench testing should be undertaken to assure the design can dissipate the required power. Proper bench testing requires attention to worst case ambient temperature and air flow. At high power dissipation levels the part will show a tendency to increase saturation voltages, thus limiting the undistorted power levels.

DETERMINING MAXIMUM POWER DISSIPATION

For a single-ended class AB power amplifier, the theoretical maximum power dissipation point is a function of the supply voltage, V_S , and the load resistance, R_L and is given by the following equation:

(single channel)

$$P_{DMAX} (W) = [V_S^2 / (2 \cdot \pi^2 \cdot R_L)] \quad (4)$$

The above equation is for a single channel class-AB power amplifier. For dual amplifiers such as the LM4752, the equation for calculating the total maximum power dissipated is:

(dual channel)

$$P_{DMAX} (W) = 2 \cdot [V_S^2 / (2 \cdot \pi^2 \cdot R_L)] \quad (5)$$

or

$$V_S^2 / (\pi^2 \cdot R_L) \quad (6)$$

(Bridged Outputs)

$$P_{DMAX} (W) = 4[V_S^2 / (2\pi^2 \cdot R_L)] \quad (7)$$

HEATSINK DESIGN EXAMPLE

Determine the system parameters:

$V_S = 24V$ Operating Supply Voltage

$R_L = 4\Omega$ Minimum load impedance

$T_A = 55^\circ\text{C}$ Worst case ambient temperature

Device parameters from the datasheet:

$T_J = 150^\circ\text{C}$ Maximum junction temperature

$\theta_{JC} = 2^\circ\text{C/W}$ Junction-to-case thermal resistance

Calculations:

$$2 \cdot P_{DMAX} = 2 \cdot [V_S^2 / (2 \cdot \pi^2 \cdot R_L)] = (24V)^2 / (2 \cdot \pi^2 \cdot 4\Omega) = 14.6W \quad (8)$$

$$\theta_{SA} \leq [(T_J - T_A) / P_{DMAX}] - \theta_{JC} - \theta_{CS} = [(150^\circ\text{C} - 55^\circ\text{C}) / 14.6W] - 2^\circ\text{C/W} - 0.2^\circ\text{C/W} = 4.3^\circ\text{C/W} \quad (9)$$

Conclusion: Choose a heatsink with $\theta_{SA} \leq 4.3^\circ\text{C/W}$.

DDPAK HEATSINK DESIGN EXAMPLES**Example 1:** (Stereo Single-Ended Output)**Given:** $T_A=30^\circ\text{C}$

$$T_J=150^\circ\text{C}$$

$$R_L=4\Omega$$

$$V_S=12\text{V}$$

$$\theta_{JC}=2^\circ\text{C/W}$$

 $P_{D\text{MAX}}$ from P_D vs P_O Graph:

$$P_{D\text{MAX}} \approx 3.7\text{W} \quad (10)$$

Calculating $P_{D\text{MAX}}$:

$$P_{D\text{MAX}} = V_{CC}^2 / (\pi^2 R_L) = (12\text{V})^2 / \pi^2(4\Omega) = 3.65\text{W} \quad (11)$$

Calculating Heatsink Thermal Resistance:

$$\theta_{SA} < [(T_J - T_A) / P_{D\text{MAX}}] - \theta_{JC} - \theta_{CS} \quad (12)$$

$$\theta_{SA} < 120^\circ\text{C} / 3.7\text{W} - 2.0^\circ\text{C/W} - 0.2^\circ\text{C/W} = 30.2^\circ\text{C/W} \quad (13)$$

Therefore the recommendation is to use 1.5 × 1.5 square inch of single-sided copper clad.

Example 2: (Stereo Single-Ended Output)**Given:** $T_A=50^\circ\text{C}$

$$T_J=150^\circ\text{C}$$

$$R_L=4\Omega$$

$$V_S=12\text{V}$$

$$\theta_{JC}=2^\circ\text{C/W}$$

 $P_{D\text{MAX}}$ from P_D vs P_O Graph:

$$P_{D\text{MAX}} \approx 3.7\text{W} \quad (14)$$

Calculating $P_{D\text{MAX}}$:

$$P_{D\text{MAX}} = V_{CC}^2 / (\pi^2 R_L) = (12\text{V})^2 / (\pi^2(4\Omega)) = 3.65\text{W} \quad (15)$$

Calculating Heatsink Thermal Resistance:

$$\theta_{SA} < [(T_J - T_A) / P_{D\text{MAX}}] - \theta_{JC} - \theta_{CS} \quad (16)$$

$$\theta_{SA} < 100^\circ\text{C} / 3.7\text{W} - 2.0^\circ\text{C/W} - 0.2^\circ\text{C/W} = 24.8^\circ\text{C/W} \quad (17)$$

Therefore the recommendation is to use 2.0 × 2.0 square inch of single-sided copper clad.

Example 3: (Bridged Output)**Given:** $T_A=50^\circ\text{C}$

$$T_J=150^\circ\text{C}$$

$$R_L=8\Omega$$

$$V_S=12\text{V}$$

$$\theta_{JC}=2^\circ\text{C/W}$$

Calculating $P_{D\text{MAX}}$:

$$P_{D\text{MAX}} = 4[V_{CC}^2 / (2\pi^2 R_L)] = 4(12\text{V})^2 / (2\pi^2(8\Omega)) = 3.65\text{W} \quad (18)$$

Calculating Heatsink Thermal Resistance:

$$\theta_{SA} < [(T_J - T_A) / P_{D\text{MAX}}] - \theta_{JC} - \theta_{CS} \quad (19)$$

$$\theta_{SA} < 100^\circ\text{C} / 3.7\text{W} - 2.0^\circ\text{C/W} - 0.2^\circ\text{C/W} = 24.8^\circ\text{C/W} \quad (20)$$

Therefore the recommendation is to use 2.0 × 2.0 square inch of single-sided copper clad.

LAYOUT AND GROUND RETURNS

Proper PC board layout is essential for good circuit performance. When laying out a PC board for an audio power amplifier, particular attention must be paid to the routing of the output signal ground returns relative to the input signal and bias capacitor grounds. To prevent any ground loops, the ground returns for the output signals should be routed separately and brought together at the supply ground. The input signal grounds and the bias capacitor ground line should also be routed separately. The 0.1 μF high frequency supply bypass capacitor should be placed as close as possible to the IC.

REVISION HISTORY

Changes from Revision D (April 2013) to Revision E	Page
• Changed layout of National Data Sheet to TI format	23

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM4752TS/NOPB	ACTIVE	DDPAK/ TO-263	KTW	7	45	Pb-Free (RoHS Exempt)	SN	Level-3-245C-168 HR	0 to 70	LM4752TS	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
