MCP6H01/2/4

1.2 MHz, 16V Op Amps

Features:

- Input Offset Voltage: ±0.7 mV (typical)
- Quiescent Current: 135 µA (typical)
- Common Mode Rejection Ratio: 100 dB (typical)
- Power Supply Rejection Ratio: 102 dB (typical)
- Rail-to-Rail Output
- Supply Voltage Range:
  - Single-Supply Operation: 3.5V to 16V
  - Dual-Supply Operation: ±1.75V to ±8V
- Gain Bandwidth Product: 1.2 MHz (typical)
- Slew Rate: 0.8V/µs (typical)
- Unity Gain Stable
- Extended Temperature Range: -40°C to +125°C
- No Phase Reversal

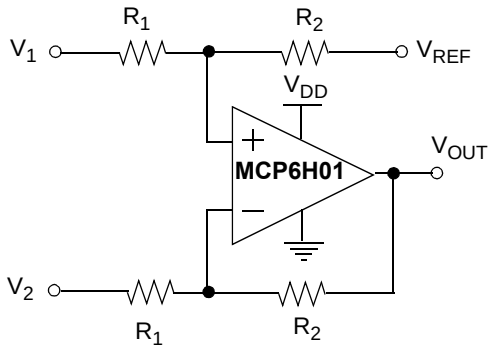
Applications:

- Automotive Power Electronics
- Industrial Control Equipment
- Battery Powered Systems
- Medical Diagnostic Instruments

Design Aids:

- SPICE Macro Models
- FilterLab® Software
- MAPS (Microchip Advanced Part Selector)
- Analog Demonstration and Evaluation Boards
- Application Notes

Typical Application



Difference Amplifier

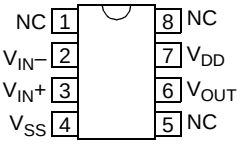
Description:

Microchip's MCP6H01/2/4 family of operational amplifiers (op amps) has a wide supply voltage range of 3.5V to 16V and rail-to-rail output operation. This family is unity gain stable and has a gain bandwidth product of 1.2 MHz (typical). These devices operate with a single-supply voltage as high as 16V, while only drawing 135 µA/amplifier (typical) of quiescent current.

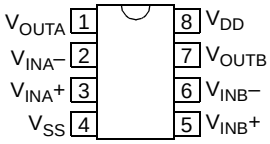
The MCP6H01/2/4 family is offered in single (MCP6H01), dual (MCP6H02) and quad (MCP6H04) configurations. All devices are fully specified in extended temperature range from -40°C to +125°C.

Package Types

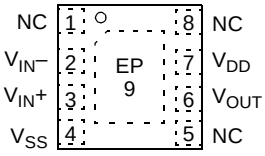
MCP6H01 SOIC



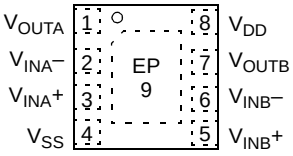
MCP6H02 SOIC



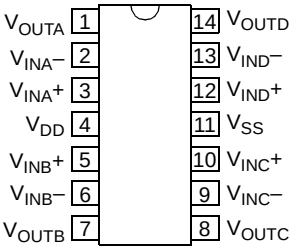
MCP6H01 2x3 TDFN



MCP6H02 2x3 TDFN



MCP6H04 SOIC, TSSOP



* Includes Exposed Thermal Pad (EP); see Table 3-1.

NOTES:

1.0 ELECTRICAL CHARACTERISTICS

1.1 Absolute Maximum Ratings †

$V_{DD} - V_{SS}$.....17V
Current at Input Pins.....±2 mA
Analog Inputs ($V_{IN}+$, $V_{IN}-$)††.....V_{SS} – 1.0V to V_{DD} + 1.0V
All Other Inputs and Outputs .....V_{SS} – 0.3V to V_{DD} + 0.3V
Difference Input Voltage.....$V_{DD} - V_{SS}$
Output Short-Circuit Current.....continuous
Current at Output and Supply Pins .....±65 mA
Storage Temperature.....-65°C to +150°C
Maximum Junction Temperature (T_J).....+150°C
ESD protection on all pins (HBM; MM).....≥ 2 kV; 200V

† Notice: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

†† See **4.1.2 "Input Voltage Limits".**

DC ELECTRICAL SPECIFICATIONS

Electrical Characteristics: Unless otherwise indicated, V_{DD} = +3.5V to +16V, V_{SS} = GND, T_A = +25°C, $V_{CM} = V_{DD}/2$ - 1.4V, $V_{OUT} \approx V_{DD}/2$, $V_L = V_{DD}/2$ and R_L = 10 kΩ to V_L. (Refer to Figure 1-1).

Parameters	Sym	Min	Typ	Max	Units	Conditions
Input Offset						
Input Offset Voltage	V_{OS}	-3.5	±0.7	+3.5	mV	
Input Offset Drift with Temperature	$\Delta V_{OS}/\Delta T_A$	—	±2.5	—	µV/°C	T_A = -40°C to +125°C

TEMPERATURE SPECIFICATIONS

Electrical Characteristics: Unless otherwise indicated, V_{DD} = +3.5V to +16V and V_{SS} = GND.						
Parameters	**Sym**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
Temperature Ranges						
Operating Temperature Range	T_A	-40	—	+125	°C	**Note 1**
Storage Temperature Range	T_A	-65	—	+150	°C	
Thermal Package Resistances						
Thermal Resistance, 8L-2x3 TDFN	θ_{JA}	—	41	—	°C/W	
Thermal Resistance, 8L-SOIC	θ_{JA}	—	149.5	—	°C/W	
Thermal Resistance, 14L-SOIC	θ_{JA}	—	95.3	—	°C/W	
Thermal Resistance, 14L-TSSOP	θ_{JA}	—	100	—	°C/W	

Note 1: The internal junction temperature (T_J) must not exceed the absolute maximum specification of +150°C.

1.2 Test Circuits

The circuit used for most DC and AC tests is shown in Figure 1-1. This circuit can independently set V_{CM} and V_{OUT} (refer to Equation 1-1). Note that V_{CM} is not the circuit's common mode voltage ((V_P + V_M)/2), and that V_{OST} includes V_{OS} plus the effects (on the input offset error, V_{OST}) of temperature, CMRR, PSRR and A_{OL}.

EQUATION 1-1:

$$G_{DM} = R_F/R_G$$
$$V_{CM} = (V_P + V_{DD}/2)/2$$
$$V_{OST} = V_{IN-} - V_{IN+}$$
$$V_{OUT} = (V_{DD}/2) + (V_P - V_M) + V_{OST} \cdot (1 + G_{DM})$$

Where:

G_{DM}	=	Differential Mode Gain	(V/V)
V_{CM}	=	Op Amp's Common Mode Input Voltage	(V)
V_{OST}	=	Op Amp's Total Input Offset Voltage	(mV)

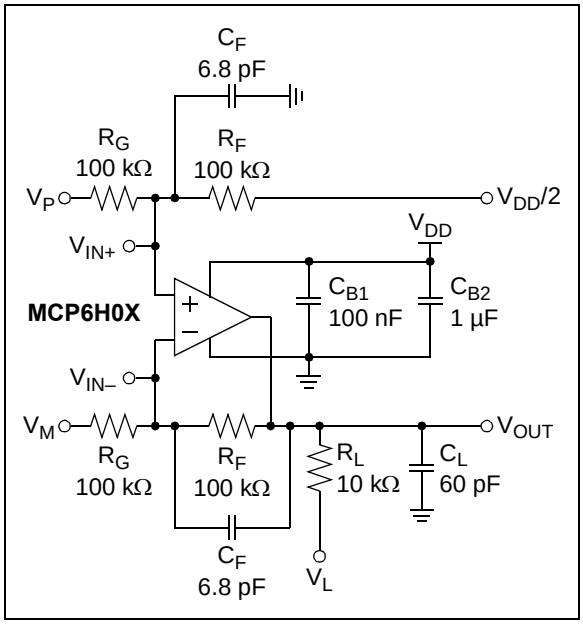

FIGURE 1-1: *AC and DC Test Circuit for Most Specifications.*

NOTES:

2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Note: Unless otherwise indicated, T_A = +25°C, V_{DD} = +3.5V to +16V, V_{SS} = GND, V_{CM} = V_{DD}/2 - 1.4V, V_{OUT} ≈ V_{DD}/2, V_L = V_{DD}/2, R_L = 10 kΩ to V_L and C_L = 60 pF.

4	4	4	4	11	V_{SS}	Negative Power Supply
—	—	—	—	12	$V_{IND}+$	Non-inverting Input (op amp D)
—	—	—	—	13	$V_{IND}-$	Inverting Input (op amp D)
—	—	—	—	14	V_{OUTD}	Analog Output (op amp D)
1, 5, 8	1, 5, 8	—	—	—	NC	No Internal Connection
—	9	—	9	—	EP	Exposed Thermal Pad (EP); must be connected to V_{SS}.

3.1 Analog Outputs

The output pins are low-impedance voltage sources.

3.2 Analog Inputs

The non-inverting and inverting inputs are high-impedance CMOS inputs with low bias currents.

3.3 Power Supply Pins

The positive power supply (V_{DD}) is 3.5V to 16V higher than the negative power supply (V_{SS}). For normal operation, the other pins are at voltages between V_{SS} and V_{DD}.

Typically, these parts can be used in single-supply operation or dual-supply operation. Also, V_{DD} will need bypass capacitors.

3.4 Exposed Thermal Pad (EP)

There is an internal electrical connection between the Exposed Thermal Pad (EP) and the V_{SS} pin; they must be connected to the same potential on the Printed Circuit Board (PCB).

NOTES:

4.0 APPLICATION INFORMATION

The MCP6H01/2/4 family of op amps is manufactured using Microchip's state-of-the-art CMOS process and is specifically designed for low-power, high-precision applications.

4.1 Inputs

4.1.1 PHASE REVERSAL

The MCP6H01/2/4 op amps are designed to prevent phase reversal when the input pins exceed the supply voltages. Figure 2-36 shows the input voltage exceeding the supply voltage without any phase reversal.

4.1.2 INPUT VOLTAGE LIMITS

In order to prevent damage and/or improper operation of these amplifiers, the circuit must limit the voltages at the input pins (see **Section 1.1 "Absolute Maximum Ratings †"**).

The ESD protection on the inputs can be depicted as shown in Figure 4-1. This structure was chosen to protect the input transistors against many (but not all) over-voltage conditions, and to minimize the input bias current (I_B).

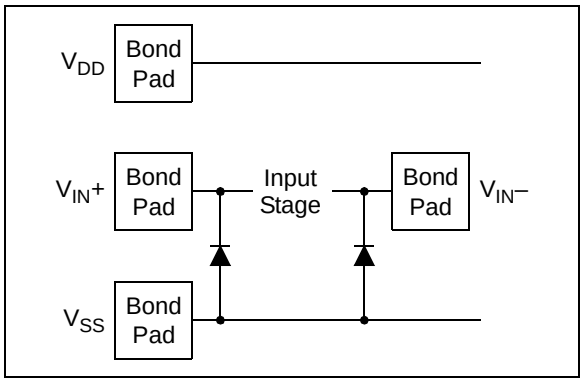

FIGURE 4-1: *Simplified Analog Input ESD Structures.*

The input ESD diodes clamp the inputs when they try to go more than one diode drop below V_{SS}. They also clamp any voltages that go well above V_{DD}; their breakdown voltage is high enough to allow normal operation, but not low enough to protect against slow over-voltage (beyond V_{DD}) events. Very fast ESD events (that meet the specification) are limited so that damage does not occur.

In some applications, it may be necessary to prevent excessive voltages from reaching the op amp inputs; Figure 4-2 shows one approach to protecting these inputs.

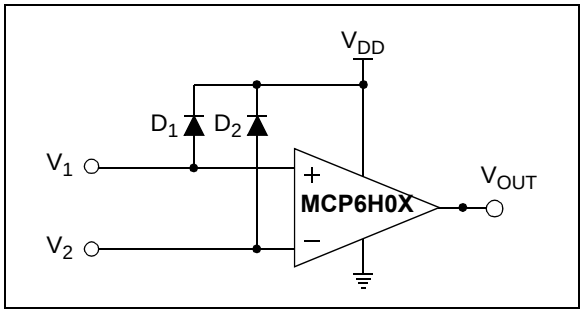

FIGURE 4-2: *Protecting the Analog Inputs.*

A significant amount of current can flow out of the inputs when the common mode voltage (V_{CM}) is below ground (V_{SS}); See Figure 2-38.

4.1.3 INPUT CURRENT LIMITS

In order to prevent damage and/or improper operation of these amplifiers, the circuit must limit the currents into the input pins (see **Section 1.1 "Absolute Maximum Ratings †"**).

Figure 4-3 shows one approach to protecting these inputs. The resistors R_1 and R_2 limit the possible currents in or out of the input pins (and the ESD diodes, D_1 and D_2). The diode currents will go through either V_{DD} or V_{SS}.

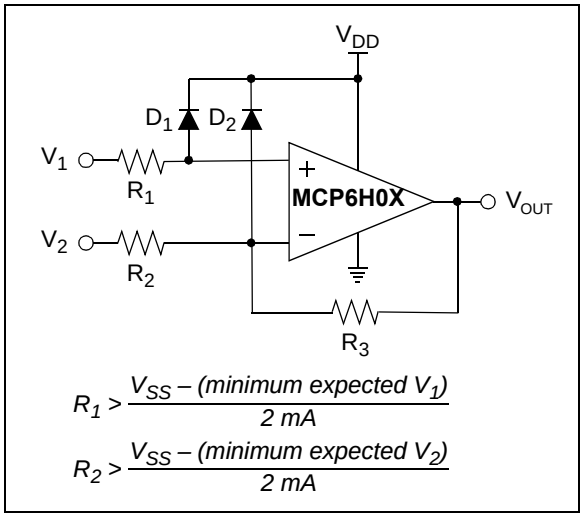

FIGURE 4-3: *Protecting the Analog Inputs.*

4.1.4 NORMAL OPERATION

The inputs of the MCP6H01/2/4 op amps connect to a differential PMOS input stage. It operates at a low common mode input voltage (V_{CM}), including ground. With this topology, the device operates with a V_{CM} up to V_{DD} – 2.3V and 0.3V below V_{SS} (refer to Figure 2-3 through 2-5). The input offset voltage is measured at $V_{CM} = V_{SS} – 0.3V$ and $V_{DD} – 2.3V$ to ensure proper operation.

For a unity gain buffer, V_{IN} must be maintained below V_{DD} – 2.3V for correct operation.

4.2 Rail-to-Rail Output

The output voltage range of the MCP6H01/2/4 op amps is 0.020V (typical) and 14.980V (typical) when R_L = 10 kΩ is connected to $V_{DD}/2$ and V_{DD} = 15V. Refer to Figures 2-24 through 2-29 for more information.

4.3 Capacitive Loads

Driving large capacitive loads can cause stability problems for voltage feedback op amps. As the load capacitance increases, the feedback loop's phase margin decreases and the closed-loop bandwidth is reduced. This produces gain peaking in the frequency response, with overshoot and ringing in the step response. While a unity-gain buffer (G = +1V/V) is the most sensitive to capacitive loads, all gains show the same general behavior.

When driving large capacitive loads with these op amps (e.g., > 100 pF when G = + 1V/V), a small series resistor at the output (R_{ISO} in Figure 4-4) improves the feedback loop's phase margin (stability) by making the output load resistive at higher frequencies. The bandwidth will generally be lower than the bandwidth with no capacitance load.

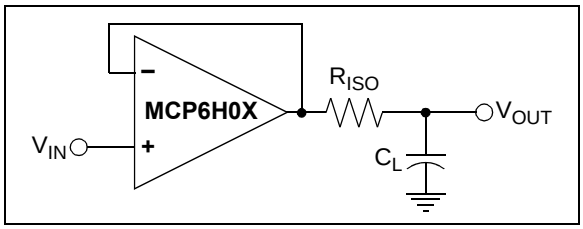

FIGURE 4-4: *Output Resistor, R_{ISO} Stabilizes Large Capacitive Loads.*

Figure 4-5 gives the recommended R_{ISO} values for different capacitive loads and gains. The x-axis is the normalized load capacitance (C_L/G_N), where G_N is the circuit's noise gain. For non-inverting gains, G_N and the Signal Gain are equal. For inverting gains, G_N is 1 + |Signal Gain| (e.g., -1V/V gives G_N = +2V/V).

After selecting R_{ISO} for your circuit, double check the resulting frequency response peaking and step response overshoot. Modify R_{ISO}'s value until the response is reasonable. Bench evaluation and simulations with the MCP6H01/2/4 SPICE macro model are very helpful.

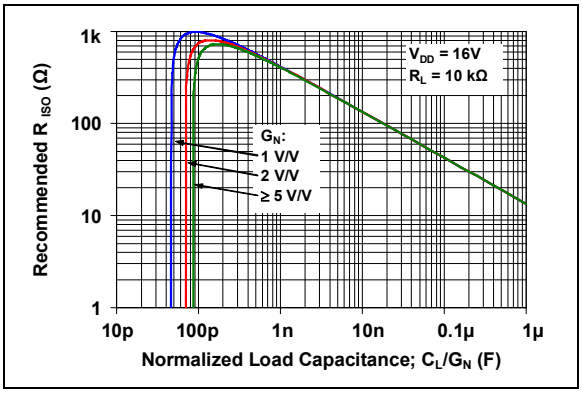

FIGURE 4-5: *Recommended R_{ISO} Values for Capacitive Loads.*

4.4 Supply Bypass

With this family of operational amplifiers, the power supply pin (V_{DD} for single supply) should have a local bypass capacitor (i.e., 0.01 µF to 0.1 µF) within 2 mm for good high-frequency performance. It can use a bulk capacitor (i.e., 1 µF or larger) within 100 mm to provide large, slow currents. This bulk capacitor can be shared with other analog parts.

4.5 Unused Op Amps

An unused op amp in a quad package (MCP6H04) should be configured as shown in Figure 4-6. These circuits prevent the output from toggling and causing crosstalk. Circuit A sets the op amp at its minimum noise gain. The resistor divider produces any desired reference voltage within the output voltage range of the op amp; the op amp buffers that reference voltage. Circuit B uses the minimum number of components and operates as a comparator, but it may draw more current.

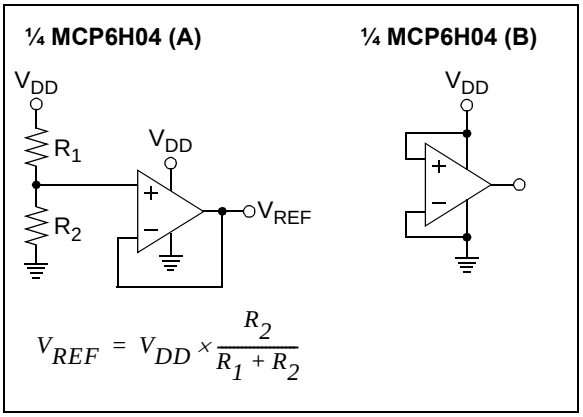

FIGURE 4-6: *Unused Op Amps.*

4.6 PCB Surface Leakage

In applications where low input bias current is critical, PCB surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low-humidity conditions, a typical resistance between nearby traces is $10^{12}\Omega$. A 15V difference would cause 15 pA of current to flow; which is greater than the MCP6H01/2/4 family's bias current at +25°C (10 pA, typical).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example of this type of layout is shown in Figure 4-7.

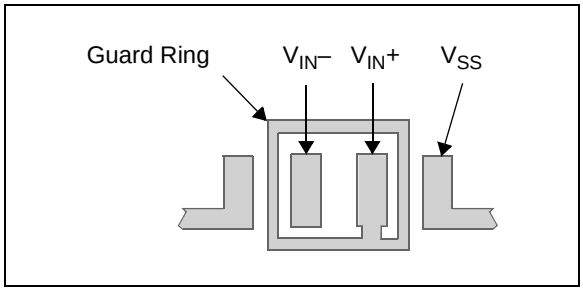

FIGURE 4-7: *Example Guard Ring Layout for Inverting Gain.*

1. Non-inverting Gain and Unity-Gain Buffer:
   a. Connect the non-inverting pin (V_{IN}+) to the input with a wire that does not touch the PCB surface.
   b. Connect the guard ring to the inverting input pin (V_{IN}–). This biases the guard ring to the common mode input voltage.
2. Inverting Gain and Trans-impedance Gain Amplifiers (convert current to voltage, such as photo detectors):
   a. Connect the guard ring to the non-inverting input pin (V_{IN}+). This biases the guard ring to the same reference voltage as the op amp (e.g., V_{DD}/2 or ground).
   b. Connect the inverting pin (V_{IN}–) to the input with a wire that does not touch the PCB surface.

4.7 Application Circuits

4.7.1 DIFFERENCE AMPLIFIER

The MCP6H01/2/4 op amps can be used in current sensing applications. Figure 4-8 shows a resistor (R_{SEN}) that converts the sensor current (I_{SEN}) to voltage, as well as a difference amplifier that amplifies the voltage across the resistor while rejecting common mode noise. R_1 and R_2 must be well matched to obtain an acceptable Common Mode Rejection Ratio (CMRR). Moreover, R_{SEN} should be much smaller than R_1 and R_2 in order to minimize the resistive loading of the source.

To ensure proper operation, the op amp common mode input voltage must be kept within the allowed range. The reference voltage (V_{REF}) is supplied by a low-impedance source. In single-supply applications, V_{REF} is typically V_{DD}/2.

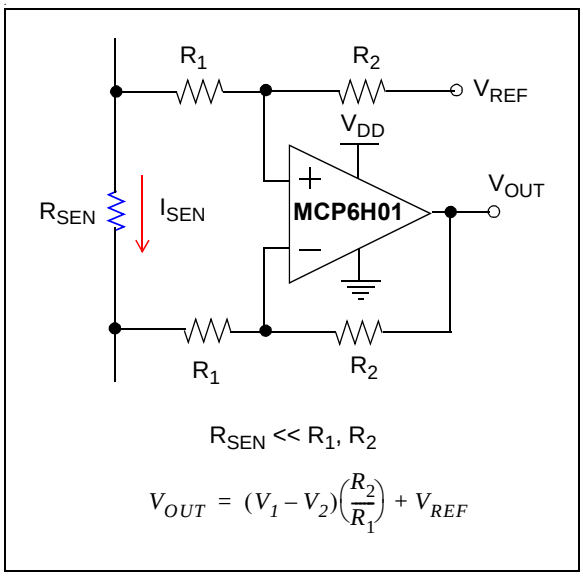

FIGURE 4-8: *High Side Current Sensing Using Difference Amplifier.*

4.7.2 TWO OP AMP INSTRUMENTATION AMPLIFIER

The MCP6H01/2/4 op amps are well suited for conditioning sensor signals in battery-powered applications. Figure 4-9 shows a two op amp instrumentation amplifier using the MCP6H02, which works well for applications requiring rejection of common mode noise at higher gains.

To ensure proper operation, the op amp common mode input voltage must be kept within the allowed range. The reference voltage (V_{REF}) is supplied by a low-impedance source. In single-supply applications, V_{REF} is typically $V_{DD}/2$.

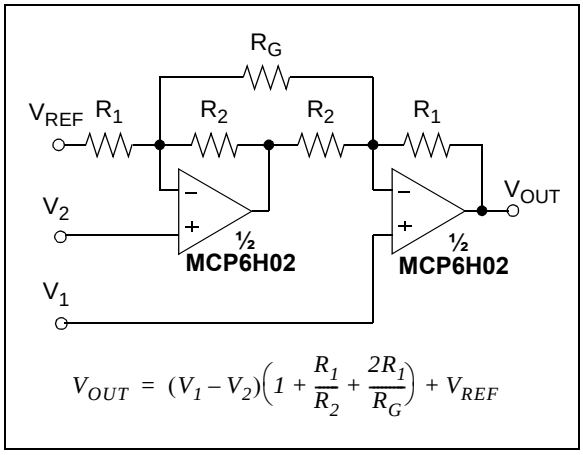

FIGURE 4-9: *Two Op Amp Instrumentation Amplifier.*

To obtain the best CMRR possible, and not limit the performance by the resistor tolerances, set a high gain with the R_G resistor.

4.7.3 PHOTODETECTOR AMPLIFIER

The MCP6H01/2/4 op amps can be used to easily convert the signal from a sensor that produces an output current (such as a photo diode) into voltage (a trans-impedance amplifier). This is implemented with a single resistor (R_2) in the feedback loop of the amplifiers shown in Figure 4-10. The optional capacitor (C_2) sometimes provides stability for these circuits.

A photodiode configured in Photovoltaic mode has a zero voltage potential placed across it. In this mode, the light sensitivity and linearity is maximized, making it best suited for precision applications. The key amplifier specifications for this application are: low input bias current, common mode input voltage range (including ground), and rail-to-rail output.

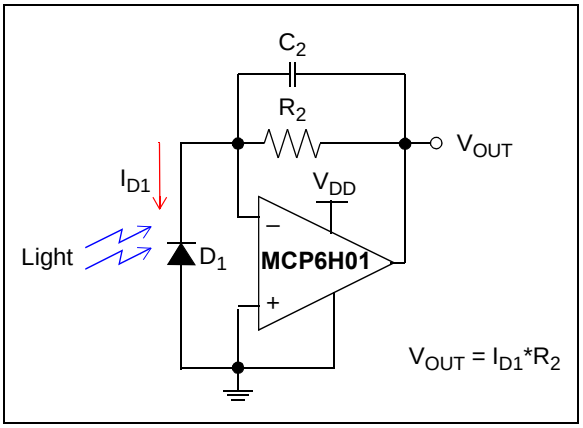

FIGURE 4-10: *Photodetector Amplifier.*

5.0 DESIGN AIDS

Microchip provides the basic design tools needed for the MCP6H01/2/4 family of op amps.

5.1 SPICE Macro Model

The latest SPICE macro model for the MCP6H01/2/4 op amp is available on the Microchip web site at www.microchip.com. The model was written and tested in PSPICE owned by Orcad (Cadence). For other simulators, it may require translation.

The model covers a wide aspect of the op amp's electrical specifications. Not only does the model cover voltage, current and resistance of the op amp, but it also covers the temperature and noise effects on the behavior of the op amp. The model has not been verified outside the specification range listed in the op amp data sheet. The model behaviors under these conditions cannot be guaranteed to match the actual op amp performance.

Moreover, the model is intended to be an initial design tool. Bench testing is a very important part of any design and cannot be replaced with simulations. Also, simulation results using this macro model need to be validated by comparing them to the data sheet specifications and characteristic curves.

5.2 FilterLab® Software

Microchip's FilterLab software is an innovative software tool that simplifies analog active filter (using op amps) design. Available at no cost from the Microchip web site at www.microchip.com/filterlab, the FilterLab design tool provides full schematic diagrams of the filter circuit with component values. It also outputs the filter circuit in SPICE format, which can be used with the macro model to simulate actual filter performance.

5.3 MAPS (Microchip Advanced Part Selector)

MAPS is a software tool that helps semiconductor professionals efficiently identify Microchip devices that fit a particular design requirement. Available at no cost from the Microchip web site at www.microchip.com/maps, MAPS is an overall selection tool for Microchip's product portfolio that includes analog, memory, MCUs and DSCs. Using this tool, you can define a filter to sort features for a parametric search of devices and export side-by-side technical comparison reports. Helpful links are also provided for data sheets, purchases and sampling of Microchip parts.

5.4 Analog Demonstration and Evaluation Boards

Microchip offers a broad spectrum of Analog Demonstration and Evaluation Boards that are designed to help you achieve faster time to market. For a complete listing of these boards and their corresponding user's guides and technical information, visit the Microchip web site: www.microchip.com/analogtools.

Some boards that are especially useful include:

- MCP6XXX Amplifier Evaluation Board 1
- MCP6XXX Amplifier Evaluation Board 2
- MCP6XXX Amplifier Evaluation Board 3
- MCP6XXX Amplifier Evaluation Board 4
- Active Filter Demo Board Kit
- 5/6-Pin SOT-23 Evaluation Board, P/N VSUPEV2
- 8-Pin SOIC/MSOP/TSSOP/DIP Evaluation Board, P/N SOIC8EV

5.5 Application Notes

The following Microchip analog design note and application notes are available on the Microchip web site at www.microchip.com/appnotes, and are recommended as supplemental reference resources.

- **ADN003:** *"Select the Right Operational Amplifier for your Filtering Circuits",* DS21821
- **AN722:** *"Operational Amplifier Topologies and DC Specifications",* DS00722
- **AN723:** *"Operational Amplifier AC Specifications and Applications",* DS00723
- **AN884:** *"Driving Capacitive Loads With Op Amps",* DS00884
- **AN990:** *"Analog Sensor Conditioning Circuits – An Overview",* DS00990
- **AN1177:** *"Op Amp Precision Design: DC Errors",* DS01177
- **AN1228:** *"Op Amp Precision Design: Random Noise",* DS01228
- **AN1297:** *"Microchip's Op Amp SPICE Macro Models"'* DS01297
- **AN1332:** *"Current Sensing Circuit Concepts and Fundamentals"'* DS01332

These application notes and others are listed in:

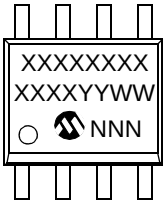
- *"Signal Chain Design Guide",* DS21825

NOTES:

6.0 PACKAGING INFORMATION

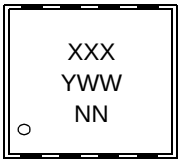
6.1 Package Marking Information

8-Lead SOIC (150 mil) **(MCP6H01, MCP6H02)**

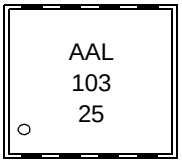


Example:

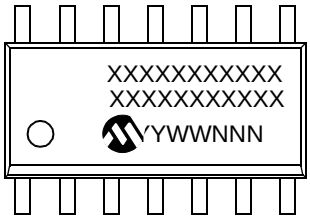
8-Lead 2x3 TDFN **(MCP6H01, MCP6H02)**



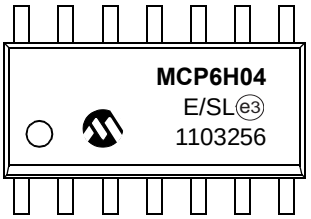
Example:



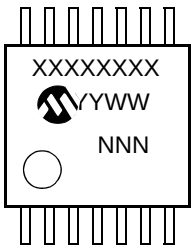
14-Lead SOIC (150 mil) (**MCP6H04**)



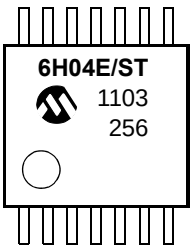
Example:



14-Lead TSSOP (**MCP6H04**)



Example:



Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

8-Lead Plastic Small Outline (SN) - Narrow, 3.90 mm Body [SOIC]

APPENDIX A: REVISION HISTORY

Revision C (March 2011)

The following is the list of modifications:

1. Added new device MCP6H04.
2. Updated Table 3-1 with MCP6H04 pin names and details.

Revision B (October 2010)

The following is the list of modifications:

1. Updated **Section 4.1 “Inputs”.**

Revision A (March 2010)

- Original Release of this Document.

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	-X	/XX
Device	Temperature Range	Package

Device:

MCP6H01:	Single Op Amp
MCP6H01T:	Single Op Amp (Tape and Reel) (SOIC and 2x3 TDFN)
MCP6H02:	Dual Op Amp
MCP6H02T:	Dual Op Amp (Tape and Reel) (SOIC and 2x3 TDFN)
MCP6H04:	Quad Op Amp
MCP6H04T:	Quad Op Amp (Tape and Reel) (SOIC and TSSOP)

Temperature Range: E = -40°C to +125°C

Package:

MNY *	=	Plastic Dual Flat, No Lead, (2x3 TDFN) 8-lead
SN	=	Lead Plastic Small Outline (150 mil Body), 8-lead
SL	=	Plastic Small Outline, (150 mil Body), 14-lead
ST	=	Plastic Thin Shrink Small Outline (150 mil Body), 14-lead

* Y = Nickel palladium gold manufacturing designator. Only available on the TDFN package.

Examples:

a)	MCP6H01-E/SN:	8LD SOIC pkg
b)	MCP6H01T-E/SN:	Tape and Reel, 8LD SOIC pkg
c)	MCP6H01T-E/MNY:	Tape and Reel, 8LD 2x3 TDFN pkg
d)	MCP6H02-E/SN:	8LD SOIC pkg
e)	MCP6H02T-E/SN:	Tape and Reel, 8LD SOIC pkg
f)	MCP6H02T-E/MNY:	Tape and Reel 8LD 2x3 TDFN pkg
g)	MCP6H04-E/SL:	14LD SOIC pkg
h)	MCP6H04T-E/SL:	Tape and Reel, 14LD SOIC pkg
i)	MCP6H04-E/ST:	14LD SOIC pkg
j)	MCP6H04T-E/ST:	Tape and Reel, 14LD TSSOP pkg

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
