2 TO 4 DIFFERENTIAL PCIE GEN1 CLOCK MUX

ICS557-06

Description

The ICS557-06 is a two to four differential clock mux designed for use in PCI-Express applications. The device selects one of the two differential HCSL input pairs and fans out to four pairs of differential HCSL or LVDS outputs.

Features

- Packaged in 20-pin TSSOP
- Pb (lead) free packaging
- Operating voltage of 3.3 V
- Low power consumption
- Input differential clock of up to 200 MHz
- Jitter 60 ps (cycle-to-cycle)
- Output-to-output skew of 50 ps
- Available in industrial temperature range (-40 to +85°C)
- **For PCIe Gen2/3 applications, see the 5V41067A**

14	CLKC	Output	Differential True output clock C.
15	VDDOUT	Power	Connect to +3.3 V. Supply Voltage for Output Clocks.
16	GND	Power	Connect to ground.
17	CLKB	Output	Differential Complimentary output clock B.
18	CLKB	Output	Differential True output clock B.
19	CLKA	Output	Differential Complimentary output clock A.
20	CLKA	Output	Differential True output clock A.

Application Information

Decoupling Capacitors

As with any high-performance mixed-signal IC, the ICS557-06 must be isolated from system power supply noise to perform optimally.

Decoupling capacitors of 0.01µF must be connected between each VDD and the PCB ground plane.

PCB Layout Recommendations

For optimum device performance and lowest output phase noise, the following guidelines should be observed.

Each 0.01µF decoupling capacitor should be mounted on the component side of the board as close to the VDD pin as possible. No vias should be used between decoupling capacitor and VDD pin. The PCB trace to VDD pin should be kept as short as possible, as should the PCB trace to the ground via. Distance of the ferrite bead and bulk decoupling from the device is less critical.

2) An optimum layout is one with all components on the same side of the board, minimizing vias through other signal layers (the ferrite bead and bulk decoupling capacitor can be mounted on the back). Other signal traces should be routed away from the ICS557-06.

This includes signal traces just underneath the device, or on layers adjacent to the ground plane layer used by the device.

External Components

A minimum number of external components are required for proper operation. Decoupling capacitors of 0.01 µF should be connected between VDD and GND pairs (2,9 and 15,16) as close to the device as possible.

Current Reference Source R_r (Iref)

If board target trace impedance (Z) is 50Ω, then Rr = 475Ω (1%), providing IREF of 2.32 mA, output current (I_{OH}) is equal to 6*IREF.

Load Resistors R_L

Since the clock outputs are open source outputs, 50 ohm external resistors to ground are to be connected at each clock output.

Output Termination

The PCI-Express differential clock outputs of the ICS557-06 are open source drivers and require an external series resistor and a resistor to ground. These resistor values and their allowable locations are shown in detail in the **PCI-Express Layout Guidelines** section.

The ICS557-06 can also be configured for LVDS compatible voltage levels. See the **LVDS Compatible Layout Guidelines** section.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS557-06. These ratings are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
