

General Description

The MAX6457–MAX6460 high supply voltage, low-power voltage monitors operate over a 4V to 28V supply voltage range. Each device includes a precision bandgap reference, one or two low-offset voltage comparators, internal threshold hysteresis, power-good or reset timeout options, and one or two high-voltage open-drain outputs. Two external resistors (three for window detection) set the trip threshold voltages.

The MAX6457 is a single voltage monitor for undervoltage or overvoltage detection. A logic-based clear input either latches the output for overvoltage applications or allows the device to operate in transparent mode. The MAX6458 includes two comparators (one overvoltage and one undervoltage) for window detection and a single output to indicate if the monitored input is within an adjustable voltage window. The MAX6459 includes dual overvoltage/undervoltage comparators with two independent comparator outputs. Use the MAX6459 as a window comparator with separate undervoltage and overvoltage outputs or as two independent, single voltage monitors. The MAX6460 includes a single comparator and an internal reference, and can also accept an external reference. The inverting and noninverting inputs of the comparator are externally accessible to support positive or negative voltage monitors and to configure the device for active-high or active-low output logic.

The MAX6457/MAX6458 offer fixed timing options as a voltage detector with a 50 μ s typical delay or as a reset circuit with a 90ms minimum reset timeout delay. The monitored input must be above the adjusted trip threshold (or within the adjusted voltage window for the MAX6458) for the selected timeout period before the output changes state. The MAX6459/MAX6460 offer only a fixed 50 μ s timeout period. Internal threshold hysteresis options (0.5%, 5%, and 8.3% for the MAX6457/MAX6458/MAX6459, and 0.5% for the MAX6460) reduce output chatter in noise-sensitive applications. Each device is available in a small SOT23 package and specified over the extended temperature range of -40°C to +125°C.

Applications

- Undervoltage Monitoring/Shutdown
- Overvoltage Monitoring/Protection
- Window Voltage Detection Circuitry
- Multicell Battery-Stack Powered Equipment
- Notebooks, eBooks
- Automotive
- Industrial
- Telecom
- Networking

Benefits and Features

- Wide Supply Voltage Range, 4V to 28V
- Internal 2.25V \pm 2.5% Reference
- Low Current (3.5 μ A, typ at 12V)
- Open-Drain n-Channel Output (28V Compliant)
- Internal Threshold Hysteresis Options (0.5%, 5%, 8.3%)
- Two IN-to-OUT Timeout Period Options (50 μ s, 150ms)
- Internal Undervoltage Lockout
- Immune to Short Voltage Transients
- Small SOT23 Packages
- Few External Components
- Fully Specified from -40°C to +125°C
- AEC-Q100 Qualified (MAX6459UT/V+ only)

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX6457UKD__-T	-40°C to +125°C	5 SOT23
MAX6458UKD__-T	-40°C to +125°C	5 SOT23
MAX6459UT/V-T	-40°C to +125°C	6 SOT23
MAX6459UT_/V+	-40°C to +125°C	6 SOT23
MAX6460UT-T	-40°C to +125°C	6 SOT23

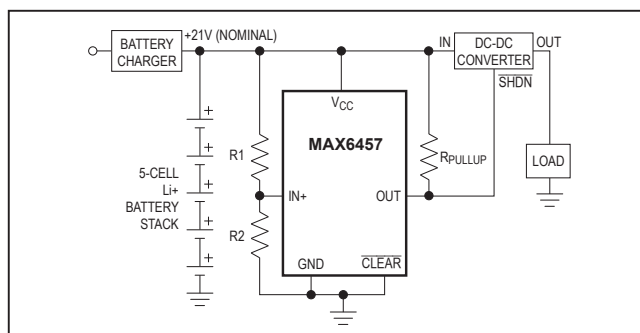

Note: The MAX6457/MAX6458/MAX6459 are available with factory-trimmed internal hysteresis options. The MAX6457 and MAX6458 offer two fixed timing options. Select the desired hysteresis and timing options using Table 1 or the Selector Guide at the end of the data sheet, and enter the corresponding letters and numbers in the part number by replacing “_” or “-”. These devices are offered in tape-and-reel only and must be ordered in 2500-piece increments.

Devices are available in both leaded and lead(Pb)-free/RoHS compliant packaging. Specify lead(Pb)-free by replacing “-T” with “+T” when ordering.

/V denotes an automotive qualified part.

Pin Configurations appears at end of data sheet.

Typical Operating Circuit

Absolute Maximum Ratings

V_{CC} , OUT, OUTA, OUTB, \overline{CLEAR} to GND -0.3V to +30.0V
 IN+, IN- to GND -0.3V to (V_{CC} + 0.3V)
 REF to GND -0.3V to the lower of +6V and (V_{CC} + 0.3V)
 Input Currents (V_{CC} , IN+, IN-) 20mA
 Sink Current (OUT, OUTA, OUTB) 20mA
 Continuous Power Dissipation (T_A = +70°C)
 5-Pin SOT23 (derate 7.1 mW/°C above +70°C) 571mW
 6-Pin SOT23 (derate 8.7 mW/°C above +70°C) 696mW

Junction Temperature +150°C
 Operating Temperature Range -40°C to +125°C
 Storage Temperature Range -65°C to +150°C
 Lead Temperature (soldering, 10s) +300°C
 Soldering Temperature (reflow)
 Lead (Pb)-free +260°C
 Containing lead (Pb) +240°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Electrical Characteristics

Figure 3. MAX6459 Functional Diagram

Figure 4. MAX6460 Functional Diagram

Detailed Description

Each of the MAX6457–MAX6460 high-voltage (4V to 28V), low-power voltage monitors include a precision bandgap reference, one or two low-offset-voltage comparators, internal threshold hysteresis, internal timeout period, and one or two high-voltage open-drain outputs.

Programming the Trip Voltage (V_{TRIP})

Two external resistors set the trip voltage, V_{TRIP} (Figure 5). V_{TRIP} is the point at which the applied voltage (typically V_{CC}) toggles OUT. The MAX6457/MAX6458/MAX6459/MAX6460's high input impedance allows large-value resistors without compromising trip-voltage accuracy. To minimize current consumption, select a value for R2 between 10kΩ and 1MΩ, then calculate R1 as follows:

$$R1 = R2 \left(\frac{V_{TRIP}}{V_{TH}} - 1 \right)$$

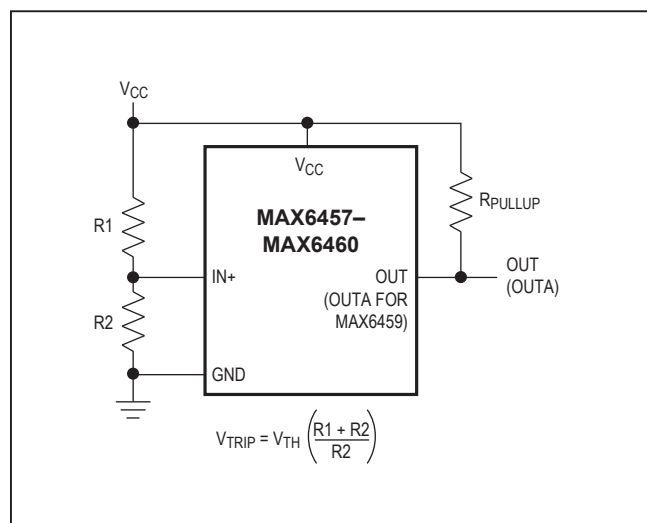

Figure 5a. Programming the Trip Voltage

where V_{TRIP} = desired trip voltage (in volts), V_{TH} = threshold trip voltage (V_{TH+} for overvoltage detection or V_{TH-} for undervoltage detection).

Use the MAX6460 voltage reference (REF) to set the trip threshold by connecting IN+ or IN- through a voltage divider (within the inputs common-mode voltage range) to REF. Do not connect REF directly to IN+ or IN- since this violates the input common-mode voltage range. Small leakage currents into the comparators inputs allows use of large value resistors to prevent loading the reference and affecting its accuracy. Figure 5b shows an active-high power-good output. Use the following equation to determine the resistor values when connecting REF to IN-:

$$V_{REFD} = V_{REF} \left(\frac{R4}{R3 + R4} \right)$$

$$R1 = R2 \left(\frac{V_{TRIP}}{V_{REFD}} - 1 \right)$$

where V_{REF} = reference output voltage (2.25V, typ), V_{REFD} = divided reference, V_{TRIP} = desired trip threshold in (in volts).

For an active-low power-good output, connect the resistor divider R1 and R2 to the inverting input and the reference-divider network to the noninverting input. Alternatively, connect an external reference less than 1.4V to either input.

Figure 5b. Programming the MAX6460 Trip Voltage

Figure 6. Input and Output Waveforms (Noninverting Input Varied)

Figure 7. Timing Diagram (MAX6457)

Hysteresis

Hysteresis adds noise immunity to the voltage monitors and prevents oscillation due to repeated triggering when V_{IN} is near the threshold trip voltage. The hysteresis in a comparator creates two trip points: one for the rising input voltage (V_{TH+}) and one for the falling input voltage (V_{TH-}). These thresholds are shown in Figure 6.

The internal hysteresis options of the MAX6457/MAX6458/MAX6459 are designed to eliminate the need for adding an external hysteresis circuit.

Timeout Period

The timeout period (t_{TP}) for the MAX6457 is the time from when the input ($IN+$) crosses the rising input threshold (V_{TH+}) to when the output goes high (see Figures 6 and 7). For the MAX6458, the monitored voltage must be in the “window” before the timeout starts. The MAX6459 and MAX6460 do not offer the extended timeout option (150ms). The extended timeout period is suitable for over-voltage protection applications requiring transient immunity to avoid false output assertion due to noise spikes.

Latched-Output Operation

The MAX6457 features a digital latch input (\overline{CLEAR}) to latch any overvoltage event. If the voltage on $IN+$ (V_{IN+}) is below the internal threshold (V_{TH-}), or if V_{CC} is below

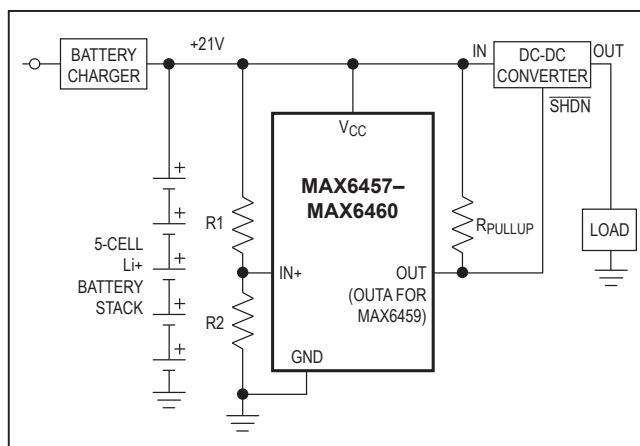

Figure 8. Undervoltage Lockout Typical Application Circuit

4V, OUT remains low regardless of the state of \overline{CLEAR} . Drive \overline{CLEAR} high to latch OUT high when V_{IN+} exceeds V_{TH+} . When \overline{CLEAR} is high, OUT does not deassert if V_{IN+} drops back below V_{TH-} . Toggle \overline{CLEAR} to deassert OUT . Drive \overline{CLEAR} low to make the latch transparent (Figure 7). \overline{CLEAR} must be low when powering up the MAX6457. To initiate self-clear at power-up, add a 100k Ω pullup resistor from \overline{CLEAR} to V_{CC} and a 1 μ F capacitor from \overline{CLEAR} to GND to hold \overline{CLEAR} low. Connect \overline{CLEAR} to GND when not used. See Figure 9.

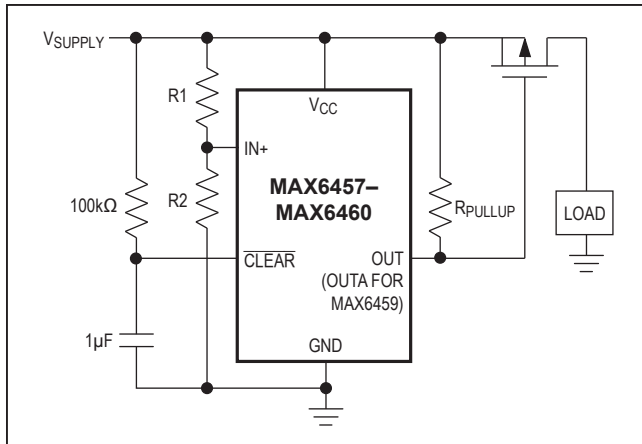

Figure 9. Overvoltage Shutdown Circuit (with External Pass MOSFET)

Applications Information

Undervoltage Lockout

Figure 8 shows the typical application circuit for detecting an undervoltage event of a 5-cell Li+ battery stack. Connect OUT of the MAX6457/MAX6458/MAX6460 (OUTA of the MAX6459) to the shutdown input of the DCDC converter to cut off power to the load in case of an undervoltage event. Select R1 and R2 to set the trip voltage (see the *Programming the Trip Voltage (V_{TRIP})* section). When the voltage of the battery stack decreases so that V_{IN+} drops below V_{TH-} of the MAX6457–MAX6460, then OUT (OUTA) goes low and disables the power supply to the load. When the battery charger restores the voltage of the 5-cell stack so that $V_{IN+} > V_{TH+}$, OUT (OUTA) goes high and the power supply resumes driving the load.

Overvoltage Shutdown

The MAX6457–MAX6460 are ideal for overvoltage shutdown applications. Figure 9 shows a typical circuit for this application using a pass P-channel MOSFET. The MAX6457–MAX6460 are powered directly from the system voltage supply. Select R1 and R2 to set the trip voltage (see the *Programming the Trip Voltage (V_{TRIP})* section). When the supply voltage remains below the selected threshold, a low logic level on OUT (OUTB for MAX6459) turns on the p-channel MOSFET. In the case of an overvoltage event, OUT (OUTB) asserts high, turns off the MOSFET, and shuts down the power to the load.

Figure 10 shows a similar application using a fuse and a silicon-controlled rectifier (SCR). An overvoltage event turns on the SCR and shorts the supply to ground. The surge of current through the short circuit blows the fuse and terminates the current to the load. Select R3 so that the gate of the SCR is properly biased when OUT (OUTB) goes high impedance.

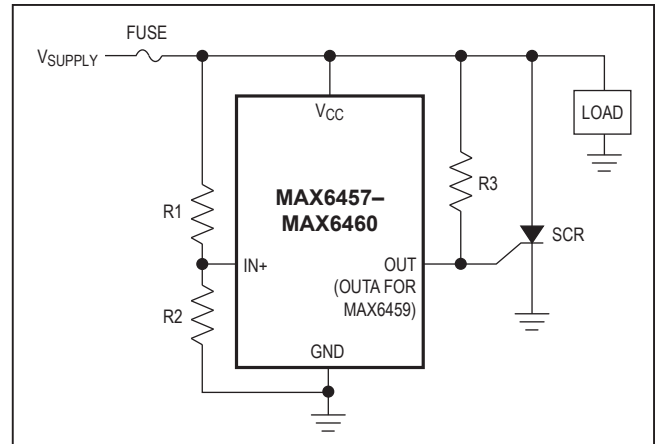

Figure 10. Overvoltage Shutdown Circuit (with SCR Fuse)

Window Detection

The MAX6458/MAX6459 include undervoltage and overvoltage comparators for window detection (Figures 2 and 3). The circuit in Figure 11 shows the typical configuration for this application. For the MAX6458, OUT asserts high when V_{CC} is within the selected “window.” When V_{CC} falls below the lower limit of the window ($V_{TRIPLOW}$) or exceeds the upper limit ($V_{TRIPHIGH}$), OUT asserts low.

The MAX6459 features two independent open-drain outputs: OUTA (for undervoltage events) and OUTB (for overvoltage events). When V_{CC} is within the selected window, OUTA and OUTB assert high. When V_{CC} falls below $V_{TRIPLOW}$, OUTA asserts low while OUTB remains

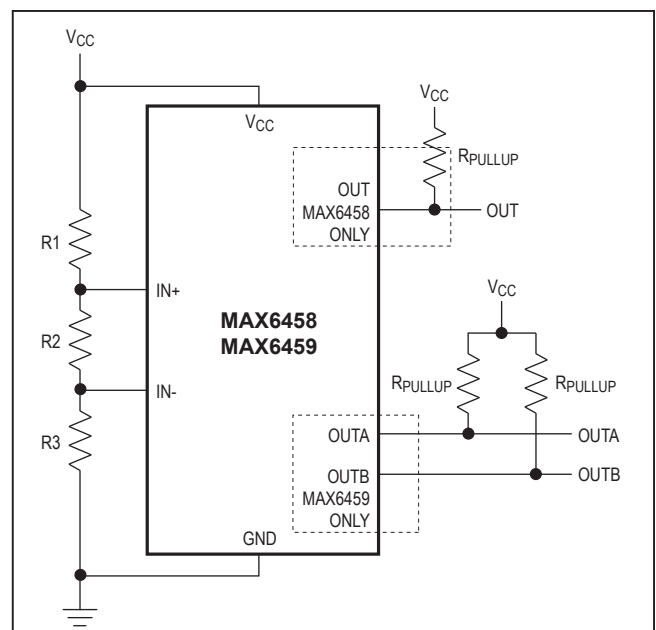

Figure 11. Window Detection

high. When V_{CC} exceeds $V_{TRIPHIGH}$, OUTB asserts low while OUTA remains high. $V_{TRIPLOW}$ and $V_{TRIPHIGH}$ are given by the following equations:

$$V_{TRIPLOW} = V_{TH-} \left(\frac{R_{TOTAL}}{R_2 + R_3} \right)$$

$$V_{TRIPHIGH} = V_{TH+} \left(\frac{R_{TOTAL}}{R_3} \right)$$

where $R_{TOTAL} = R_1 + R_2 + R_3$.

Use the following steps to determine the values for R1, R2, and R3.

- 1) Choose a value for R_{TOTAL} , the sum of R1, R2, and R3. Because the MAX6458/MAX6459 have very high input impedance, R_{TOTAL} can be up to 5M Ω .
- 2) Calculate R3 based on R_{TOTAL} and the desired upper trip point:

$$R_3 = \frac{V_{TH+} \times R_{TOTAL}}{V_{TRIPHIGH}}$$

- 3) Calculate R2 based on R_{TOTAL} , R3, and the desired lower trip point:

$$R_2 = \frac{V_{TH-} \times R_{TOTAL}}{V_{TRIPLOW}} - R_3$$

- 4) Calculate R1 based on R_{TOTAL} , R3, and R2:

$$R_1 = R_{TOTAL} - R_2 - R_3$$

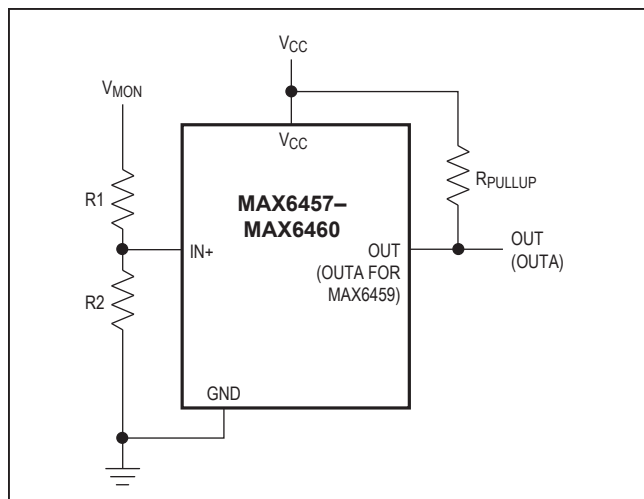

Figure 12. Monitoring Voltages Other than V_{CC}

Example Calculations for Window Detection

The following is an example for calculating R1, R2, and R3 of Figure 11 for window detection. Select the upper and lower trip points ($V_{TRIPHIGH}$ and $V_{TRIPLOW}$).

$$V_{CC} = 21V$$

$$V_{TRIPHIGH} = 23.1V$$

$$V_{TRIPLOW} = 18.9V$$

For 5% hysteresis, $V_{TH+} = 1.228$ and $V_{TH-} = 1.167$.

- 1) Choose $R_{TOTAL} = 4.2M\Omega = R_1 + R_2 + R_3$
- 2) Calculate R3

$$R_3 = \frac{V_{TH+} \times R_{TOTAL}}{V_{TRIPHIGH}} = \frac{(1.228V)(4.2M\Omega)}{23.1V}$$

$$= 223.273k\Omega$$

- 3) Calculate R2

$$\begin{aligned}
 R2 &= \frac{V_{TH} \times R_{TOTAL}}{V_{TRIPLOW}} - R3 \\
 &= \frac{(1.167V)(4.2M\Omega)}{18.9V} - 223.273k\Omega \\
 &= 36.06k\Omega
 \end{aligned}$$

4) Calculate R1

$$\begin{aligned}
 R1 &= R_{TOTAL} - R2 - R3 \\
 &= 4.2M\Omega - 223.273k\Omega - 36.06k\Omega \\
 &= 3.94067M\Omega
 \end{aligned}$$

Monitoring Voltages Other than V_{CC}

The MAX6457–MAX6460 can monitor voltages other than V_{CC} (Figure 12). Calculate V_{TRIP} as shown in the *Programming the Trip Voltage (V_{TRIP})* section. The monitored voltage (V_{MON}) is independent of V_{CC}. V_{IN+} must be within the specified operating range: 0 to V_{CC}.

Interfacing to Voltages Other than V_{CC}

The open-drain outputs of the MAX6457–MAX6460 allow the output voltage to be selected independent of V_{CC}. For systems requiring an output voltage other than V_{CC}, connect the pullup resistor between OUT, OUTA, or OUTB and any desired voltage up to 28V (see Figure 13).

Monitoring Negative Voltages

Figure 14 shows the typical application circuit for monitoring negative voltages (V_{NEG}) using the MAX6460. Select a value for R1 between 25kΩ and 1MΩ. Use the following equation to select R2:

$$R2 = R1 \times \frac{-V_{NEG}}{V_{REF}}$$

where V_{REF} = 2.25V and V_{NEG} < 0. V_{IN+} must always be within the specified operating range: 0 to V_{CC}.

For pricing, delivery, and ordering information, please contact Maxim Direct at 1-888-629-4642, or visit Maxim Integrated's website at www.maximintegrated.com.

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the Electrical Characteristics table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.
