

# LP8720 One Step-Down DC-DC and Five Linear Regulators with I<sup>2</sup>C-Compatible Interface

 Check for Samples: [LP8720](#)

## FEATURES

- 5 Low Noise LDO's for up to 300 mA
- One High-Efficiency Synchronous Magnetic Buck Regulator, I<sub>OUT</sub> 400 mA
  - High Efficiency PFM Mode @Low I<sub>OUT</sub>
  - Auto Mode PFM/PWM Switch
  - Low Inductance 2.2 μH @ 2 MHz Clock
  - Dynamic Voltage Scale Control
- I<sup>2</sup>C-Compatible Interface for the Controlling of Internal Registers
- 20-Bump 2.5 x 2.0 mm DSBGA Package

## KEY SPECIFICATIONS

- Programmable V<sub>OUT</sub> from 0.8V to 2.3V on DC-DC
- Automatic Soft Start on DC-DC
- 200 mV Typ Dropout Voltage at 300 mA on LDO's
- 2% (Typ) Output Voltage Accuracy on LDO's

## APPLICATIONS

- Cellular Handsets
- Portable Hand-Held Products

## DESCRIPTION

The LP8720 is a multi-function, programmable Power Management Unit, optimized for sub block power requirement solutions. This device integrates one highly efficient 400 mA step-down DC-DC converter with Dynamic Voltage Scale (DVS), five low-noise low dropout (LDO) voltage regulators, and a 400 KHz I<sup>2</sup>C-compatible interface to allow a host controller access to the internal control registers of the LP8720. Additionally, the LP8720 features programmable power-on sequencing.

LDO regulators provide high PSRR and low noise ideally suited for supplying power to both analog and digital loads. The package will be the smallest 2.5 mm x 2.0 mm 20-bump DSBGA package.

## Typical Application Diagram

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

### LP8720 PIN DESCRIPTIONS<sup>(1)</sup>

| Pin Number | Name   | Type | Description   |
|------------|--------|------|---|
| A4         | VBATT  | P    | Battery Input for LDO1 and all internal circuitry.  |
| E4         | VINB   | P    | Battery Input for Buck.   |
| A2         | VIN1   | P    | Battery Input for LDO2 and LDO3.  |
| D1         | VIN2   | P    | Battery Input for LDO4 and LDO5.  |
| B4         | LDO1   | A    | LDO1 Output.  |
| A3         | LDO2   | A    | LDO2 Output.  |
| A1         | LDO3   | A    | LDO3 Output.  |
| C1         | LDO4   | A    | LDO4 Output.  |
| E1         | LDO5   | A    | LDO5 Output.  |
| E3         | SW     | A    | Buck Output.  |
| D2         | FB     | A    | Buck Feedback.  |
| D4         | GNDB   | G    | Power Ground for Buck.  |
| B1         | GND    | G    | IC Ground.  |
| C4         | SDA    | DI/O | I <sup>2</sup> C-compatible Serial Interface Data Input/Output. Open Drain output, external pull up resistor is needed, typ 1.5 kΩ. If not in use then hard wire to GND.  |
| C3         | SCL    | DI   | I <sup>2</sup> C-compatible Serial Interface Clock input. External pull-up resistor is needed, typ 1.5 kΩ. If not in use then hard-wire to GND.   |
| B3         | IRQ_N  | DO   | Interrupt output, active LOW. Open Drain output, external pull-up resistor is needed, typ 10 kΩ. If not in use then hard-wire to GND or leave floating.   |
| E2         | EN     | DI   | Enable. EN=LO standby. EN=HI power on. Internal pull-down resistor 500 kΩ.<br><b>If not in use then hard wire to VBATT.</b>   |
| B2         | DEFSEL | DI   | Control input that sets the default voltages and startup sequence. Must be hard wired to BATT or GND or left floating (Hi-Z) for specific application.<br>When DEFSEL= VBATT then setup 1 is used for default voltages and startup sequence.<br>When DEFSEL= GND then setup 2 is used for default voltages and startup sequence.<br>When DEFSEL= floating (Hi-Z) setup 3 is used for default voltages and startup sequence. |
| C2         | IDSEL  | DI   | Control input that sets the slave address for serial interface. Must be hard-wired to BATT or GND or left floating (Hi-Z) for specific application.<br>When IDSEL= VBATT then slave address is 7h'7F.<br>When IDSEL= floating (Hi-Z) then slave address is 7h'7C.<br>When IDSEL= GND then slave address is 7h'7D.   |

**LP8720 PIN DESCRIPTIONS<sup>(1)</sup> (continued)**

| Pin Number | Name | Type | Description  |
|------------|------|------|--|
| D3         | DVS  | DI   | Dynamic Voltage Scaling.<br>When DVS=HI then Buck voltage set BUCK_V1 is in use.<br>When DVS=LO then Buck voltage set BUCK_V2 is in use.<br>Buck voltage set BUCK_V1 should be higher than Buck voltage set BUCK_V2.<br><b>If not in use then hard wire to VBATT or GND.</b> |

**Device Description**

**Operation Modes**

**POWER-ON-RESET:** After VBATT gets above POR higher threshold, the DEFSEL pin and IDSEL pin are read. All internal registers of LP8720 then are reset to the default values; after that the LP8720 goes to STANDBY mode. This process duration max is 500 µs.

**STANDBY:** In STANDBY mode only serial interface is working and all other PMU functions are disabled – PMU is in low-power condition. In STANDBY mode the LP8720 can be (re)configured via Serial Interface.

**STARTUP:** STARTUP sequence is defined by registers contents. STARTUP sequence starts:

- 1) If rising edge on EN pin.
  - 2) After cooling down from thermal shutdown event if EN = HI.
- It is not recommended to write to LP8720 registers during startup. If doing so then current startup sequence may become undefined.

**IDLE:** PMU will enter into IDLE mode (normal operating mode) after end of startup sequence. In IDLE mode all LDO's and BUCK can be enabled/disabled via Serial Interface. Also in IDLE mode LP8720 can be (re)configured via Serial Interface.

**SHUTDOWN:** SHUTDOWN sequence is “reverse order of startup sequence,” and this is defined by registers contents. SHUTDOWN starts:

- 1) If falling edge on EN pin.
- 2) If temperature exceeds thermal shutdown threshold TSD +160°C.

It is not recommended to write to LP8720 registers during SHUTDOWN. If doing so then current SHUTDOWN sequence may become undefined.

**Additional Functions**

**SLEEP:** If sum of all LDOs' load currents and BUCK load current is no higher than 5 mA , the user can put PMU to SLEEP. In SLEEP PMU GND current is minimized, and LDO's and BUCK cannot be loaded with bigger current.

There are 2 possibilities to use SLEEP:

- 1) Control via Serial Interface.
- 2) Control by DVS pin.

**DVS:** Dynamic Voltage Scaling allows using 2 voltage sets for BUCK. There are 2 possibilities to use DVS:  
 1) Control via Serial Interface.  
 2) Control by DVS pin.

**INTERRUPT:** If interrupt is not masked, the PMU forces IRQ\_N low if the temperature crosses the TSD\_EW limit (thermal shutdown early warning) or/and a thermal shutdown event has taken place. IRQ\_N is released by reading Interrupt register.

**Power-On and Power-Off Sequences**

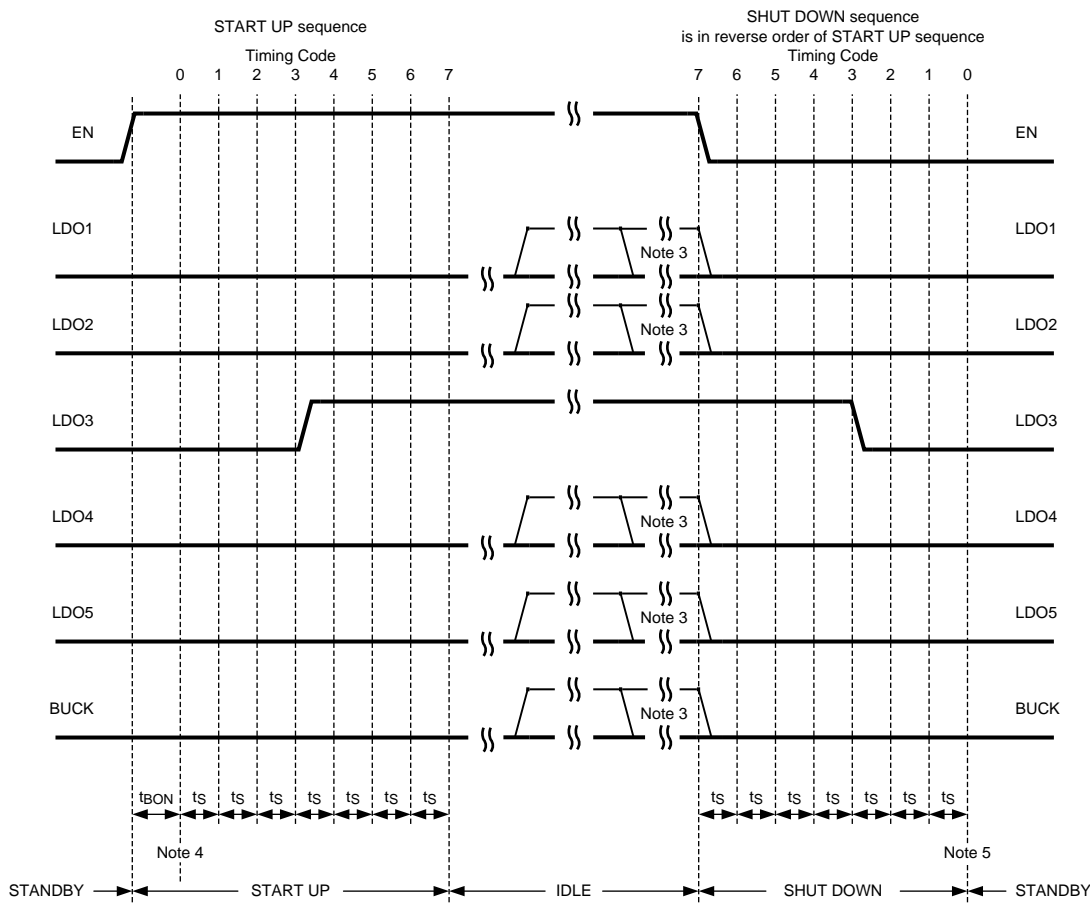

$t_{BON}$  150  $\mu$ s – Reference and bias turn ON. Min 100  $\mu$ s max 200  $\mu$ s.

$t_s$  25  $\mu$ s – time step. Time step accuracy is defined by OSC frequency accuracy.

- (1) STARTUP and SHUTDOWN sequences are defined by registers. Sequences given here are valid if there are no register changes via Serial Interface.
- (2) The timing shown here defines time points when LDO's and BUCK are enabled/disabled. Enabling /disabling process duration depends on loading conditions. Buck startup duration is 140  $\mu$ s for no load. LDO startup duration is no more than 35  $\mu$ s. For details please see LDO's and BUCK Electrical Specifications.
- (3) LDO5 and BUCK are disabled. If LDO5 and/or BUCK are enabled via Serial Interface, and startup sequence is not changed via Serial interface, then LDO5 and BUCK are disabled with no delay from falling edge on EN pin.
- (4) At this time point registers 0x09 and 0x0C are reset to POR default values.
- (5) At this time point registers 0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07 and 0x08 are reset to POR default values.

**Figure 2. Startup Sequence if DEFSEL=VBATT or DEFSEL=Hi-Z**

$t_{BON}$  150  $\mu$ s – Reference and bias turn ON. Min 100  $\mu$ s max 200  $\mu$ s.

$t_s$  25  $\mu$ s – time step. Time step accuracy is defined by OSC frequency accuracy.

- (1) STARTUP and SHUTDOWN sequences are defined by registers. Sequences given here are valid if there the registers are not rewritten via Serial Interface.
- (2) The timing showed here define time points when LDO's and BUCK are enabled/disabled. Enabling /disabling process duration depends on loading conditions. Buck startup duration is 140  $\mu$ s for no load. LDO startup duration is no more than 35  $\mu$ s. For details please see LDO's and BUCK Electrical Specifications.
- (3) LDO1, LDO2, LDO4, LDO5 and BUCK are disabled. If LDO1, LDO2, LDO4, LDO5 and/or BUCK are enabled via Serial Interface and startup sequence is not changed via Serial interface, then LDO1, LDO2, LDO4, LDO5 and BUCK are disabled with no delay from falling edge on EN-pin.
- (4) At this time point registers 0x09 and 0x0C are reset to POR default values.
- (5) At this time point registers 0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07 and 0x08 are reset to POR default values.

**Figure 3. Startup Sequence if DEFSEL=GND**

**Table 1. Startup Sequence<sup>(1)</sup>**

| DEFSEL | Startup Sequence  | Shutdown Sequence                     |
|--------|---|---------------------------------------|
| VBATT  | LDO1, 2, 3, 4 enable same time.<br>LDO5 and BUCK enable via Serial Interface. | In reverse order of startup sequence. |
| GND    | LDO3 enable.<br>LDO1, 2, 4, 5 and BUCK enable via Serial Interface .          | In reverse order of startup sequence. |
| Hi-Z   | LDO1, 2, 3, 4 enable same time.<br>LDO5 and BUCK enable via Serial Interface. | In reverse order of startup sequence. |

- (1) When IDSEL= VBATT then slave address is 7h'7F.  
When IDSEL= floating (Hi-Z) then slave address is 7h'7C.  
When IDSEL= GND then slave address is 7h'7D.

**Table 2. Default Output Voltages<sup>(1)(2)</sup>**

| Output | Max Current [mA] | Default output Voltage [V] and default ON/OFF if EN=HI |                           |             |
|--------|------------------|--|---------------------------|-------------|
|        |                  | DEFSEL=VBATT   | DEFSEL=GND                | DEFSEL=Hi-Z |
| LDO1   | 300              | 3.0 ON   | 3.0 OFF                   | 2.8 ON      |
| LDO2   | 300              | 2.6 ON   | 3.0 OFF                   | 2.6 ON      |
| LDO3   | 300              | 1.8 ON   | 2.6 ON                    | 1.8 ON      |
| LDO4   | 300              | 1.0 ON   | 2.6 OFF                   | 1.2 ON      |
| LDO5   | 300              | 3.3 OFF  | 3.3 OFF                   | 3.3 OFF     |
| BUCK   | 400              | 1.0 OFF  | 1.2/1.3 <sup>1)</sup> OFF | 1.2 OFF     |

- (1) BUCK voltage is 1.2V if DVS=LO and 1.3V if DVS=HI.
- (2) When IDSEL= VBATT then slave address is 7h'7F  
 When IDSEL= floating (Hi-Z) then slave address is 7h'7C  
 When IDSEL= GND then slave address is 7h'7D

## Support Functions

### Reference

The LP8720 has an internal reference block creating all necessary references and biasing for all blocks.

### Oscillator

There is an internal oscillator giving clock to the bucks and to logic control.

| Parameter            | Typ | Min | Max | Unit |
|----------------------|-----|-----|-----|------|
| Oscillator frequency | 2.0 | 1.9 | 2.1 | MHz  |

## Thermal Shutdown

The Thermal Shutdown (TSD) function monitors the chip temperature to protect the chip from temperature damage caused eg. by excessive power dissipation. The temperature monitoring function has two threshold values, TSD and TSD\_EW, that result in protective actions.

When TSD\_EW +125°C is exceeded, IRQ\_N is set to low, and “1” is written to the TSD\_EW bit in both the STATUS register and in INTERRUPT register.

If the temperature exceeds TSD +160°C, then PMU initiates Emergency Shutdown.

The POWER-UP operation after Thermal Shutdown can be initiated only after the chip has cooled down to the +115°C threshold.

| Parameter                        | Typ | Unit |
|----------------------------------|-----|------|
| TSD <sup>(1)</sup>               | 160 | °C   |
| TSD_EW <sup>(1)</sup>            | 125 | °C   |
| TSD_EW Hysteresis <sup>(1)</sup> | 10  | °C   |

(1) Ensured by design.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## Absolute Maximum Ratings<sup>(1)(2)(3)</sup>

|   |   |
|---|---|
| V <sub>BATT</sub> = VINB, VBATT   | -0.3V to +6V                              |
| VIN1, VIN2  | -0.3V to V <sub>BATT</sub> +0.15V, max 6V |
| All other pins  | -0.3V to V <sub>BATT</sub> +0.3V, max 6V  |
| Junction Temperature (T <sub>J-MAX</sub> )                              | 150°C                                     |
| Storage Temperature   | -40 to 150°C                              |
| Maximum Continuous Power Dissipation, P <sub>D-MAX</sub> <sup>(4)</sup> | 1.75 W                                    |
| ESD <sup>(5)</sup>  | 2 kV HBM                                  |
|   | 200V MM                                   |

- (1) Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is specified. Operating Ratings do not imply ensured performance limits. For specified performance limits and associated test conditions, see the Electrical Characteristics tables.
- (2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/ Distributors for availability and specifications.
- (3) All voltages are with respect to the potential at the GND pin.
- (4) The Absolute Maximum power dissipation depends on the ambient temperature and can be calculated using the formula  $P = (T_J - T_A)/\theta_{JA}$ , (eq. 1) where  $T_J$  is the junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance. The 1.75-W rating appearing under Absolute Maximum Ratings results from substituting the Absolute Maximum junction temperature, 150°C for  $T_J$ , 70°C for  $T_A$ , and 45°C/W for  $\theta_{JA}$ . More power can be dissipated safely at ambient temperatures below 70°C. Less power can be dissipated safely at ambient temperatures above 70°C. The Absolute Maximum power dissipation can be increased by 22 mW for each degree below 70°C, and it must be de-rated by 22 mW for each degree above 70°C.
- (5) The human-body model is 100 pF discharged through 1.5 kΩ. The machine model is a 200-pF capacitor discharged directly into each pin, MIL-STD-883 3015.7.

## Operating Ratings<sup>(1)(2)</sup>

|   |                    |
|---|--------------------|
| $V_{BATT} = VINB, VBATT$  | 2.7 to 4.5V        |
| VIN1, VIN2  | 2.5V to $V_{BATT}$ |
| All input-only pins   | 0V to $V_{BATT}$   |
| Junction Temperature ( $T_J$ )  | -40 to 125°C       |
| Ambient Temperature ( $T_A$ )   | -40 to 85°C        |
| Maximum Power Dissipation ( $T_A = 70^\circ\text{C}$ ) <sup>(3)</sup> | 1.2 W              |

- (1) Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is specified. Operating Ratings do not imply ensured performance limits. For specified performance limits and associated test conditions, see the Electrical Characteristics tables.
- (2) All voltages are with respect to the potential at the GND pin.
- (3) Like the Absolute Maximum power dissipation, the maximum power dissipation for operation depends on the ambient temperature. The 1.2W rating for DSBGA 20 appearing under Operating Ratings results from substituting the maximum junction temperature for operation, 125°C, for  $T_J$ , 70°C for  $T_A$ , and 45°C/W for  $\theta_{JA}$  into (eg. 1) above. More power can be dissipated at ambient temperatures below 70°C. Less power can be dissipated at ambient temperatures above 70°C. The maximum power dissipation for operation can be increased by 22mW for each degree below 70°C, and it must be de-rated by 22 mW for each degree above 70°C.

## Thermal Properties<sup>(1)</sup>

|   |        |
|---|--------|
| Junction-to-Ambient Thermal Resistance ( $\theta_{JA}$ )<br>(Jedec Standard Thermal PCB)<br>20-bump DSBGA package | 45°C/W |
|---|--------|

- (1) Junction-to-ambient thermal resistance is highly application and board-layout dependent. In applications where high maximum power dissipation exists, special care must be paid to thermal dissipation issues in board design.

## Current Consumption

Unless otherwise noted,  $V_{VBATT} = V_{VINB} = V_{VIN1} = V_{VIN2} = 3.6\text{V}$ ,  $\text{GND} = \text{GNDB} = 0\text{V}$ ,  $C_{VBATT} = C_{VIN1} = C_{VIN2} = 2.2\ \mu\text{F}$ ,  $C_{VINB} = 10\ \mu\text{F}$ . Typical values and limits appearing in normal type apply for  $T_J = 25^\circ\text{C}$ . Limits appearing in **boldface** type apply over the entire junction temperature range for operation,  $T_J = -40$  to  $+125^\circ\text{C}$ <sup>(1)</sup>

| Parameter               | Test Conditions                        | Typ                               | Limit |            | Units         |
|-------------------------|--|-----------------------------------|-------|------------|---------------|
|                         |  |                                   | Min   | Max        |               |
| $I_{Q(\text{STANDBY})}$ | Battery Standby Current                | $V_{BATT} = 3.6\text{V}$          | 0.7   | 5          | $\mu\text{A}$ |

| $I_{Q(\text{SLEEP})}$   | Battery Current in SLEEP Mode @ 0 load | LDO3 enabled                      | 100   | <b>150</b> | $\mu\text{A}$ |
| $I_{Q(\text{SLEEP})}$   | Battery Current in SLEEP Mode @ 0 load | LDO1 and BUCK enabled             | 100   |            | $\mu\text{A}$ |
| $I_Q$                   | Battery Current @ 0 load               | BUCK and all LDO's enabled        | 270   | <b>400</b> | $\mu\text{A}$ |
| $I_Q$                   | Battery Current @ 0 load               | LDO1, LDO2, LDO3 and LDO4 enabled | 230   |            | $\mu\text{A}$ |
| $I_Q$                   | Battery Current @ 0 load               | LDO3 enabled                      | 120   | <b>200</b> | $\mu\text{A}$ |
| $I_Q$                   | Battery Current @ 0 load               | LDO1 and BUCK enabled             | 120   |            | $\mu\text{A}$ |

- (1) All limits are specified. All electrical characteristics having room-temperature limits are tested during production with  $T_J = 25^\circ\text{C}$ . All hot and cold limits are ensured by correlating the electrical characteristics to process and temperature variations and applying statistical process control.

## Power-On Reset<sup>(1)</sup>

Unless otherwise noted,  $V_{VBATT} = V_{VINB} = V_{VIN1} = V_{VIN2} = 3.6V$ ,  $GND = GNDB = 0V$ ,  $C_{VBATT} = C_{VIN1} = C_{VIN2} = 2.2 \mu F$ ,  $C_{VINB} = 10 \mu F$ . Typical values and limits appearing in normal type apply for  $T_J = 25^\circ C$ . Limits appearing in **boldface** type apply over the entire junction temperature range for operation,  $T_J = -40$  to  $+125^\circ C$ .<sup>(1)</sup>

| Parameter           |                      | Test Conditions                           | Typ | Limit |     | Units |
|---------------------|----------------------|---|-----|-------|-----|-------|
|                     |                      |   |     | Min   | Max |       |
| V <sub>POR_HI</sub> | POR higher threshold | V <sub>VBATT</sub> rising                 | 2.2 | 2.0   | 2.4 | V     |
| V <sub>POR_LO</sub> | POR lower threshold  | V <sub>VBATT</sub> falling <sup>(2)</sup> | 1.4 |       |     | V     |

(1) All limits are specified. All electrical characteristics having room-temperature limits are tested during production with  $T_J = 25^\circ C$ . All hot and cold limits are ensured by correlating the electrical characteristics to process and temperature variations and applying statistical process control.

(2) Ensured by design.

## Logic and Control

Unless otherwise noted,  $V_{VBATT} = V_{VINB} = V_{VIN1} = V_{VIN2} = 3.6V$ ,  $GND = GNDB = 0V$ ,  $C_{VBATT} = C_{VIN1} = C_{VIN2} = 2.2 \mu F$ ,  $C_{VINB} = 10 \mu F$ . Typical values and limits appearing in normal type apply for  $T_J = 25^\circ C$ . Limits appearing in **boldface** type apply over the entire junction temperature range for operation,  $T_J = -40$  to  $+125^\circ C$ .<sup>(1)</sup>

**Output Voltage Selection Using External Resistor Divider**

Buck1 output voltage can be programmed via the selection of the external feedback resistor network.

$V_{OUT}$  will be adjusted to make the voltage at FB equal to 0.5V. The resistor from FB to ground  $R_{FB2}$  should be around 200 k $\Omega$  to keep the current drawn through the resistor network to a minimum but large enough that it is not susceptible to noise. With  $R_{FB2} = 200 \text{ k}\Omega$  and  $V_{FB}$  at 0.5V, the current through the resistor feedback network will be 2.5  $\mu A$ .

The formula for output voltage selection is

$$V_{OUT} = V_{FB} \times \left( 1 + \frac{R_{FB1}}{R_{FB2}} \right)$$

- $V_{OUT}$  – output voltage
  - $V_{FB}$  – feedback voltage (0.5V)
- (1)

For any out voltage greater than or equal to 0.8V a transfer function zero should be added by the addition of a capacitor C1. The formula for calculation of C1 is:

$$C1 = \frac{1}{(2 \times \pi \times R_{FB1} \times 45 \times 10^3)}$$
(2)

For recommended component values see the table below.

| $V_{OUT}$ [V] | $R_{FB1}$ [k $\Omega$ ] | $R_{FB2}$ [k $\Omega$ ] | C1 [pF] | L [ $\mu$ H] | $C_{OUT}$ [ $\mu$ F] |
|---------------|-------------------------|-------------------------|---------|--------------|----------------------|
| 1.0           | 200                     | 200                     | 18      | 2.2          | 10                   |
| 1.2           | 280                     | 200                     | 12      | 2.2          | 10                   |
| 1.4           | 360                     | 200                     | 10      | 2.2          | 10                   |
| 1.5           | 360                     | 180                     | 10      | 2.2          | 10                   |
| 1.6           | 440                     | 200                     | 8.2     | 2.2          | 10                   |
| 1.85          | 540                     | 200                     | 6.8     | 2.2          | 10                   |

## LDO's

There are, all together, 5 LDO's in the LP8720 grouped as:

- A-type LDO's (LDO2, 3)
- D-type LDO's (LDO1, 5)
- LO-type LDO (LDO 4)

The A-type LDO's are optimized for supplying of analog loads and have ultra low noise (15  $\mu$ V<sub>RMS</sub>) and excellent PSRR (70 dB) performance.

The D-type LDO's are optimized for good dynamic performance to supply different fast changing (digital) loads.

The LO-type LDO is optimized for low output voltage and for good dynamic performance to supply different fast changing (digital) loads.

All LDO's can be programmed through serial interface for 32 different output voltage values, which are summarized in the Output Voltage Programming tables below.

At the PMU power on, LDO's start up according to the selected startup sequence, and the default voltages after startup sequence depend on startup setup. See section [Power-On and Power-Off Sequences](#) for details.

For stability all LDO's have to be connected to output an external capacitor  $C_{OUT}$  with recommended value of 1  $\mu$ F. It is important to select the type of capacitor which capacitance will in no case (voltage, temperature, etc) be outside of limits specified in the LDO Electrical Characteristics.

**Table 12. LDO1, 2, 3 and 5 Output Voltage Programming**

| Data Code LDOx_V | LDOx [V] | Data Code LDOx_V | LDOx [V] |
|------------------|----------|------------------|----------|
| 5h'00            | 1.20     | 5h'10            | 2.10     |
| 5h'01            | 1.25     | 5h'11            | 2.20     |
| 5h'02            | 1.30     | 5h'12            | 2.30     |
| 5h'03            | 1.35     | 5h'13            | 2.40     |

- (1) All limits are specified. All electrical characteristics having room-temperature limits are tested during production with  $T_J = 25^\circ C$ . All hot and cold limits are ensured by correlating the electrical characteristics to process and temperature variations and applying statistical process control.
- (2) Dropout voltage is the input-to-output voltage difference at which the output voltage is 100mV below its nominal value. This specification does not apply in cases it implies operation with an input voltage below the 2.5V minimum appearing under Operating Ratings. For example, this specification does not apply for devices having 1.5V outputs because the specification would imply operation with an input voltage at or about 1.5V.
- (3) Ensured by design.

## D-Type and LO-Type LDO Electrical Characteristics

Unless otherwise noted,  $V_{VBATT} = V_{VINB} = V_{VIN1} = V_{VIN2} = 3.6V$ ,  $GND = GNDB = 0V$ ,  $C_{VBATT} = C_{VIN1} = C_{VIN2} = 2.2 \mu F$ ,  $C_{VINB} = 10 \mu F$ . Typical values and limits appearing in normal type apply for  $T_J = 25^\circ C$ . Limits appearing in **boldface** type apply over the entire junction temperature range for operation,  $T_J = -40$  to  $+125^\circ C$ <sup>(1)</sup>

- (1) All limits are specified. All electrical characteristics having room-temperature limits are tested during production with  $T_J = 25^\circ C$ . All hot and cold limits are ensured by correlating the electrical characteristics to process and temperature variations and applying statistical process control.
- (2) Dropout voltage is the input-to-output voltage difference at which the output voltage is 100mV below its nominal value. This specification does not apply in cases it implies operation with an input voltage below the 2.5V minimum appearing under Operating Ratings. For example, this specification does not apply for devices having 1.5V outputs because the specification would imply operation with an input voltage at or about 1.5V.
- (3) Ensured by design.

## D-Type and LO-Type LDO Electrical Characteristics (continued)

Unless otherwise noted,  $V_{VBATT} = V_{VINB} = V_{VIN1} = V_{VIN2} = 3.6V$ ,  $GND = GNDB = 0V$ ,  $C_{VBATT} = C_{VIN1} = C_{VIN2} = 2.2 \mu F$ ,  $C_{VINB} = 10 \mu F$ . Typical values and limits appearing in normal type apply for  $T_J = 25^\circ C$ . Limits appearing in **boldface** type apply over the entire junction temperature range for operation,  $T_J = -40$  to  $+125^\circ C$ <sup>(1)</sup>

## I<sup>2</sup>C-COMPATIBLE SERIAL BUS INTERFACE

### Interface Bus Overview

The I<sup>2</sup>C compatible synchronous serial interface provides access to the programmable functions and registers on the device.

This protocol uses a two-wire interface for bi-directional communications between the IC's connected to the bus. The two interface lines are the Serial Data Line (SDA), and the Serial Clock Line (SCL). These lines should be connected to a positive supply, via a pull-up resistor of 1.5 k $\Omega$ , and remain HIGH even when the bus is idle.

Every device on the bus is assigned a unique address and acts as either a Master or a Slave depending on whether it generates or receives the serial clock (SCL).

### Data Transactions

One data bit is transferred during each clock pulse. Data is sampled during the high state of the serial clock (SCL). Consequently, throughout the clock's high period, the data should remain stable. Any changes on the SDA line during the high state of the SCL and in the middle of a transaction, aborts the current transaction. New data should be sent during the low SCL state. This protocol permits a single data line to transfer both command/control information and data using the synchronous serial clock.

Figure 4. Bit Transfer

Each data transaction is composed of a Start Condition, a number of byte transfers (set by the software) and a Stop Condition to terminate the transaction. Every byte written to the SDA bus must be 8 bits long and is transferred with the most significant bit first. After each byte, an Acknowledge signal must follow. The following sections provide further details of this process.

### Start and Stop

The Master device on the bus always generates the Start and Stop Conditions (control codes). After a Start Condition is generated, the bus is considered busy and it retains this status until a certain time after a Stop Condition is generated. A high-to-low transition of the data line (SDA) while the clock (SCL) is high indicates a Start Condition. A low-to-high transition of the SDA line while the SCL is high indicates a Stop Condition.

Figure 5. Start and Stop Conditions

In addition to the first Start Condition, a repeated Start Condition can be generated in the middle of a transaction. This allows another device to be accessed, or a register read cycle.

## Acknowledge Cycle

The Acknowledge Cycle consists of two signals: the acknowledge clock pulse the master sends with each byte transferred, and the acknowledge signal sent by the receiving device.

The master generates the acknowledge clock pulse on the ninth clock pulse of the byte transfer. The transmitter releases the SDA line (permits it to go high) to allow the receiver to send the acknowledge signal. The receiver must pull down the SDA line during the acknowledge clock pulse and ensure that SDA remains low during the high period of the clock pulse, thus signaling the correct reception of the last data byte and its readiness to receive the next byte.

**Figure 6. Bus Acknowledge Cycle**

## “Acknowledge After Every Byte” Rule

The master generates an acknowledge clock pulse after each byte transfer. The receiver sends an acknowledge signal after every byte received.

There is one exception to the “acknowledge after every byte” rule.

When the master is the receiver, it must indicate to the transmitter an end of data by not-acknowledging (“negative acknowledge”) the last byte clocked out of the slave. This “negative acknowledge” still includes the acknowledge clock pulse (generated by the master), but the SDA line is not pulled down.

## Addressing Transfer Formats

Each device on the bus has a unique slave address. The LP8720 operates as a slave device. Slave address is selectable by IDSEL-pin.

- When IDSEL= VBATT then slave address is 7h'7F.
- When IDSEL= floating (Hi-Z) then slave address is 7h'7C.
- When IDSEL= GND then slave address is 7h'7D.

Before any data is transmitted, the master transmits the address of the slave being addressed. The slave device should send an acknowledge signal on the SDA line, once it recognizes its address.

The slave address is the first seven bits after a Start Condition. The direction of the data transfer (R/W) depends on the bit sent after the slave address — the eighth bit.

When the slave address is sent, each device in the system compares this slave address with its own. If there is a match, the device considers itself addressed and sends an acknowledge signal. Depending upon the state of the R/W bit (1:read, 0:write), the device acts as a transmitter or a receiver.

## Control Register Write Cycle

- Master device generates start condition.
- Master device sends slave address (7 bits) and the data direction bit (r/w = '0').
- Slave device sends acknowledge signal if the slave address is correct.
- Master sends control register address (8 bits).
- Slave sends acknowledge signal.
- Master sends data byte to be written to the addressed register.

- Slave sends acknowledge signal.
- If master will send further data bytes the control register address will be incremented by one after acknowledge signal.
- Write cycle ends when the master creates stop condition.

### Control Register Read Cycle

- Master device generates a start condition.
- Master device sends slave address (7 bits) and the data direction bit (r/w = '0').
- Slave device sends acknowledge signal if the slave address is correct.
- Master sends control register address (8 bits).
- Slave sends acknowledge signal.
- Master device generates repeated start condition.
- Master sends the slave address (7 bits) and the data direction bit (r/w = "1").
- Slave sends acknowledge signal if the slave address is correct.
- Slave sends data byte from addressed register.
- If the master device sends acknowledge signal, the control register address will be incremented by one. Slave device sends data byte from addressed register.
- Read cycle ends when the master does not generate acknowledge signal after data byte and generates stop condition.

|  | Address Mode   |
|--|--|

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
