

LCD row/column driver for dot matrix graphic displays Rev. 06 — 5 May 2009

Product data sheet

General description 1.

The PCF8578 is a low power CMOS¹ LCD row and column driver, designed to drive dot matrix graphic displays at multiplex rates of 1:8, 1:16, 1:24 or 1:32. The device has 40 outputs, of which 24 are programmable and configurable for the following ratios of rows/columns: 32/8, 24/16, 16/24 or 8/32. The PCF8578 can function as a stand-alone LCD controller and driver for use in small systems. For larger systems it can be used in conjunction with up to 32 PCF8579s for which it has been optimized. Together these two devices form a general purpose LCD dot matrix driver chip set, capable of driving displays of up to 40960 dots. The PCF8578 is compatible with most microcontrollers and communicates via a two-line bidirectional bus (I²C-bus). Communication overhead is minimized by a display RAM with auto-incremented addressing and display bank switching.

Features 2.

- Single chip LCD controller and driver
- Stand-alone or may be used with up to 32 PCF8579s (40960 dots possible)
- 40 driver outputs, configurable for several ratios of rows/columns: ³²/₈, ²⁴/₁₆, ¹⁶/₂₄ or ⁸/₃₂
- Selectable multiplex rates: 1:8, 1:16, 1:24 or 1:32
- Externally selectable bias configuration, 5 or 6 levels
- 1280-bit RAM for display data storage and scratch pad
- Display memory bank switching
- Auto-incremented data loading across hardware subaddress boundaries (with PCF8579)
- Provides display synchronization for PCF8579
- On-chip oscillator, requires only 1 external resistor
- Power-On Reset (POR) blanks display
- Logic voltage supply range 2.5 V to 6 V
- Maximum LCD supply voltage 9 V
- Low power consumption
- I²C-bus interface
- Compatible with most microcontrollers
- Optimized pinning for single plane wiring in multiple device applications (with PCF8579)
- Space saving 56-lead small outline package and 64 pin quad flat pack

The definition of the abbreviations and acronyms used in this data sheet can be found in Section 15. 1.

LCD row/column driver for dot matrix graphic displays

3. Applications

- Automotive information systems
- Telecommunication systems
- Point-of-sale terminals
- Industrial computer terminals
- Instrumentation

8. Functional description

8.1 Display configurations

The PCF8578 row and column driver is designed for use in one of three ways:

- Stand-alone row and column driver for small displays (mixed mode)
- Row and column driver with cascaded PCF8579s (mixed mode)
- Row driver with cascaded PCF8579s (mixed mode and row mode)

Applicatio n	Multiplex rate	Mixed mode		Row mode		Typical applications		
		Rows	Columns	Rows	Columns	-		
stand alone	1:8	8	32	-	-	small digital or		
	1:16	16	24	-	-	alphanumeric displays		
	1:24	24	16	-	-			
	1:32	32	8	-	-			
with	1:8	8 <u>[1]</u>	632 <mark>[1]</mark>	8 × 4 ^[2]	640 <mark>[2]</mark>	alphanumeric displays and dot matrix graphic displays		
PCF8579	1:16	16 <mark>1]</mark>	624 <mark>[1]</mark>	16 × 2 ^[2]	640 <mark>[2]</mark>			
	1:24	24 <mark>1]</mark>	616 <mark>11</mark>	24 <mark>[2]</mark>	640 <mark>[2]</mark>			
	1:32	32 <mark>[1]</mark>	608 <mark>[1]</mark>	32 <mark>[2]</mark>	640 <mark>[2]</mark>			

Table 4.Possible display configurations

[1] Using 15 PCF8579s.

[2] Using 16 PCF8579s.

In mixed mode, the device functions as both a row and column driver. It can be used in small stand-alone applications, or for larger displays with up to 15 PCF8579s (31 PCF8579s when two slave addresses are used). See <u>Table 4</u> for common display configurations.

In row mode, the device functions as a row driver with up to 32 row outputs and provides the clock and synchronization signals for the PCF8579. Up to 16 PCF8579s can normally be cascaded (32 when two slave addresses are used).

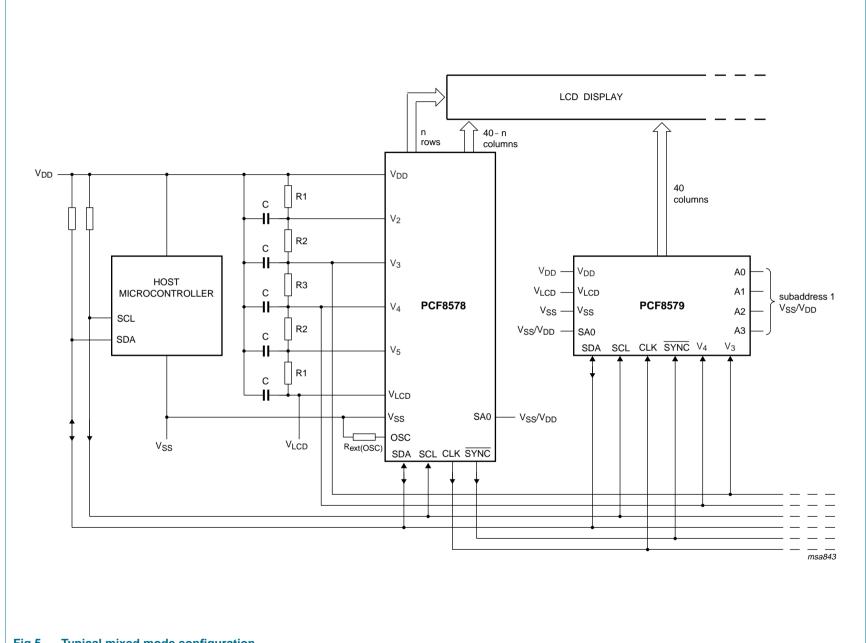

Timing signals are derived from the on-chip oscillator, whose frequency is determined by the value of the resistor connected between pin OSC and pin V_{SS} .

Five commands are available to configure and control the operation of the device. Communication is made via a two-line bidirectional I²C-bus. The device may have one of two slave addresses. The only difference between these slave addresses is the least significant bit, which is set by the logic level applied to SA0. The PCF8578 and PCF8579 have different subaddresses. The subaddress of the PCF8578 is only defined in mixed mode and is fixed at 0111 100 (see Section 8.8.7 on page 19). The RAM may only be accessed in mixed mode and data is loaded as described for the PCF8579.

Bias levels may be generated by an external potential divider with appropriate decoupling capacitors. For large displays, bias sources with high drive capability should be used. A typical mixed mode system operating with up to 15 PCF8579s is shown in Figure 5 (a stand-alone system would be identical but without the PCF8579).

Rev. 06 — 5 May 2009

PCF8578

<u>Table 5</u> shows the relative values of the resistors required in the configuration of <u>Figure 5</u> to produce the standard multiplex rates.

Resistors	Multiplex rate (1:n)				
	n = 8	n = 16, 24, 32			
R1	R	R			
R2	$(\sqrt{n}-2)R$	R			
R3	$(3-\sqrt{n})R$	$(\sqrt{n}-3)R$			

Table 5.Multiplex rates and resistor values for Figure 5

8.2 Power-on reset

At power-on the PCF8578 resets to a defined starting condition as follows:

- 1. Display blank
- 2. 1:32 multiplex rate, row mode
- 3. Start bank 0 selected
- 4. Data pointer is set to X, Y address 0, 0
- 5. Character mode
- 6. Subaddress counter is set to 0
- 7. I²C-bus interface is initialized

Remark: Do not transfer data on the I^2C -bus for at least 1 ms after power-on to allow the reset action to complete.

8.3 Multiplexed LCD bias generation

The bias levels required to produce maximum contrast depend on the multiplex rate and the LCD threshold voltage (V_{th}). V_{th} is typically defined as the RMS voltage at which the LCD exhibits 10 % contrast. Table 6 shows the optimum voltage bias levels and Table 7 the discrimination ratios (D) for the different multiplex rates as functions of V_{oper} .

$$V_{oper} = V_{DD} - V_{LCD} \tag{1}$$

The RMS on-state voltage $(V_{on(RMS)})$ for the LCD is calculated with the equation

$$V_{on(RMS)} = V_{oper} \sqrt{\frac{1}{n} + \frac{\sqrt{n} - 1}{n(\sqrt{n} + 1)}}$$
(2)

and the RMS off-state voltage $(V_{off(RMS)})$ with the equation

$$V_{off(RMS)} = V_{oper} \sqrt{\frac{2(\sqrt{n}-1)}{\sqrt{n}(\sqrt{n}+1)^2}}$$
(3)

where the values for n are determined by the multiplex rate (1:n). Valid values for n are:

- n = 8 for 1:8 multiplex
- n = 16 for 1:16 multiplex
- n = 24 for 1:24 multiplex
- n = 32 for 1:32 multiplex

Table 6. Optimum LCD voltages

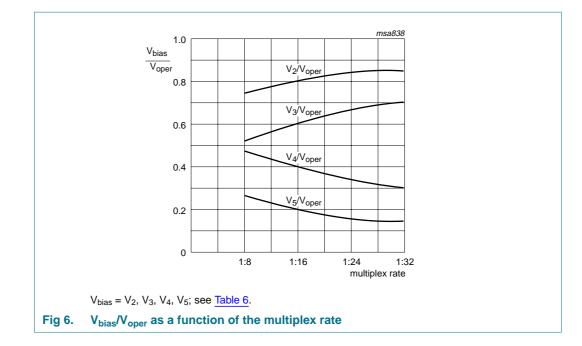

Bias ratios	Multiplex rate								
	1:8	1:16	1:24	1:32					
$\frac{V_2}{V_{oper}}$	0.739	0.800	0.830	0.850					
$\frac{V_3}{V_{oper}}$	0.522	0.600	0.661	0.700					
$\frac{V_4}{V_{oper}}$	0.478	0.400	0.339	0.300					
$\frac{V_5}{V_{oper}}$	0.261	0.200	0.170	0.150					

Table 7.Discrimination ratios

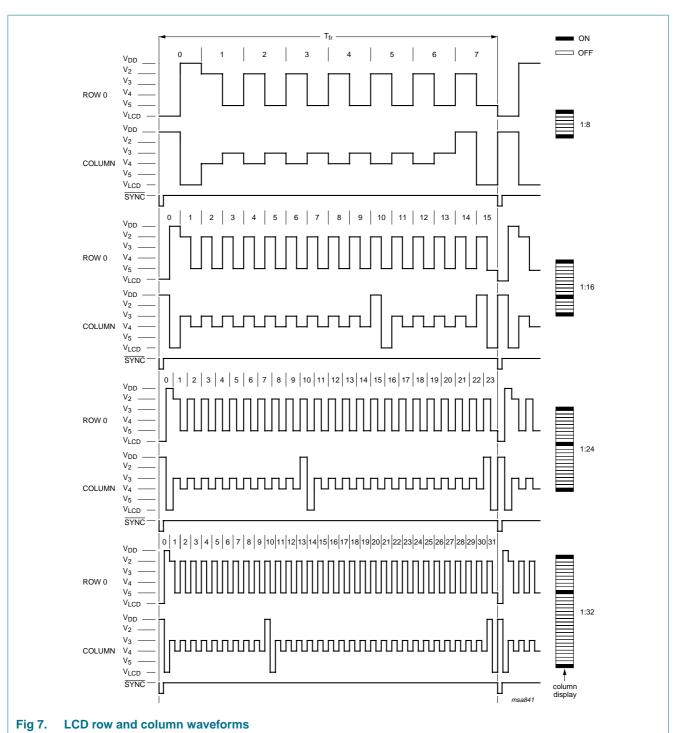

Discrimination	Multiplex rat	Multiplex rate							
ratios	1:8	1:16	1:24	1:32					
$\frac{V_{off(RMS)}}{V_{oper}}$	0.297	0.245	0.214	0.193					
$\frac{V_{on(RMS)}}{V_{oper}}$	0.430	0.316	0.263	0.230					
$D = \frac{V_{on(RMS)}}{V_{off(RMS)}}$	1.447	1.291	1.230	1.196					
$\frac{V_{oper}}{V_{th}}$	3.370	4.080	4.680	5.190

8.5 Oscillator

8.5.1 Internal clock

The clock signal for the system may be generated by the internal oscillator and prescaler. The frequency is determined by the value of the resistor $R_{ext(OSC)}$, see Figure 10. For normal use a value of 330 k Ω is recommended. The clock signal, for cascaded PCF8579s, is output at CLK and has a frequency of $\frac{1}{6}$ (multiplex rate 1:8, 1:16 and 1:32) or $\frac{1}{8}$ (multiplex rate 1:24) of the oscillator frequency.

8.5.2 External clock

If an external clock is used, OSC must be connected to V_{DD} and the external clock signal to CLK. Table 8 summarizes the nominal CLK and \overline{SYNC} frequencies.

Oscillator frequency, f _{osc} (Hz) ^[2]	Frame frequency, f _{fr} (Hz)	Multiplex rate, (1:n)	Division ratio	Clock frequency, f _{clk} (Hz)
12288	64	1:8, 1:16, 1:32	6	2048
12288	64	1:24	8	1536

Table 8.	Signal frequencies	required for nominal	64 Hz frame frequency[1]
----------	--------------------	----------------------	--------------------------

[1] A clock signal must always be present, otherwise the LCD may be frozen in a DC state.

[2] $R_{ext(OSC)} = 330 \text{ k}\Omega.$

8.6 Timing generator

The timing generator of the PCF8578 organizes the internal data flow of the device and generates the LCD frame synchronization pulse SYNC, whose period is an integer multiple of the clock period. In cascaded applications, this signal maintains the correct timing relationship between the PCF8578 and PCF8579s in the system.

8.7 Row and column drivers

Outputs R0 to R7 and C32 to C39 are fixed as row and column drivers respectively. The remaining 24 outputs R8/C8 to R31/C31 are programmable and may be configured (in blocks of 8) to be either row or column drivers. The row select signal is produced sequentially at each output from R0 up to the number defined by the multiplex rate (see <u>Table 4</u>). In mixed mode the remaining outputs are configured as columns. In row mode all programmable outputs (R8/C8 to R31/C31) are defined as row drivers and the outputs C32 to C39 should be left open-circuit.

Using a 1:16 multiplex rate, two sets of row outputs are driven, thus facilitating split-screen configurations, i.e. a row select pulse appears simultaneously at R0 and R16/C16, R1 and R17/C17 etc. Similarly, using a multiplex rate of 1:8, four sets of row outputs are driven simultaneously. Driver outputs must be connected directly to the LCD. Unused outputs should be left open circuit.

Depending on the multiplex rate the following outputs are rows:

- In MUX 1:8 R0 to R7
- In MUX 1:16 R0 to R15/C15
- In MUX 1:24 R0 to R23/C23
- In MUX 1:32 R0 to R31/C31

The configuration of the outputs (row or column) and the selection of the appropriate driver waveforms are controlled by the display mode controller.

8.8 Characteristics of the I²C-bus

The I²C-bus is for bidirectional, two-line communication between different ICs or modules. The two lines are a Serial Data Line (SDA) and a Serial Clock Line (SCL) which must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

8.8.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this moment will be interpreted as control signals.

8.8.2 START and STOP conditions

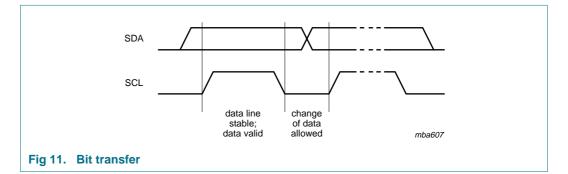

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH, is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH, is defined as the STOP condition (P).

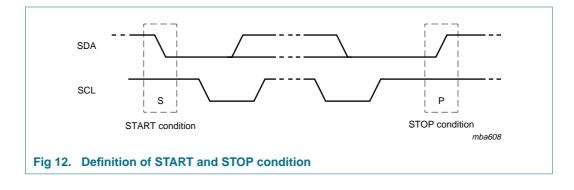

8.8.3 System configuration

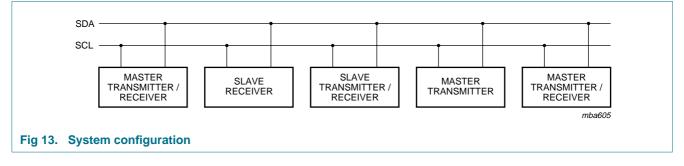

A device transmitting a message is a transmitter, a device receiving a message is the receiver. The device that controls the message flow is the master and the devices which are controlled by the master are the slaves.

8.8.4 Acknowledge

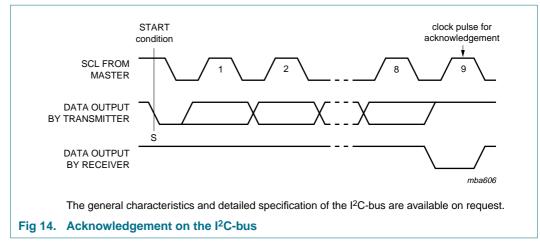

The number of data bytes transferred between the START and STOP conditions from transmitter to receiver is unlimited. Each data byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter, whereas the master generates an extra acknowledge related clock pulse. A slave receiver which is addressed must generate an acknowledge after the reception of each byte. Also a master must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull down the SDA line during the acknowledge related clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be taken into consideration). A master receiver must signal the end of a data transmission to the transmitter by **not** generating an acknowledge on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a STOP condition.

LCD row/column driver for dot matrix graphic displays

8.8.5 I²C-bus controller

The I²C-bus controller detects the I²C-bus protocol, slave address, commands and display data bytes. It performs the conversion of the data input (serial-to-parallel) and the data output (parallel-to-serial). The PCF8578 acts as an I²C-bus slave transmitter/receiver in mixed mode, and as a slave receiver in row mode. A slave device cannot control bus communication.

8.8.6 Input filters

To enhance noise immunity in electrically adverse environments, RC low-pass filters are provided on the SDA and SCL lines.

8.8.7 I²C-bus protocol

Two 7-bit slave addresses (0111 100 and 0111 101) are reserved for both the PCF8578 and PCF8579. The least significant bit of the slave address is set by connecting input SA0 to either logic 0 (V_{SS}) or logic 1 (V_{DD}). Therefore, two types of PCF8578 or PCF8579 can be distinguished on the same I²C-bus which allows:

- 1. One PCF8578 to operate with up to 32 PCF8579s on the same I²C-bus for very large applications.
- 2. The use of two types of LCD multiplex schemes on the same I²C-bus.

In most applications the PCF8578 will have the same slave address as the PCF8579.

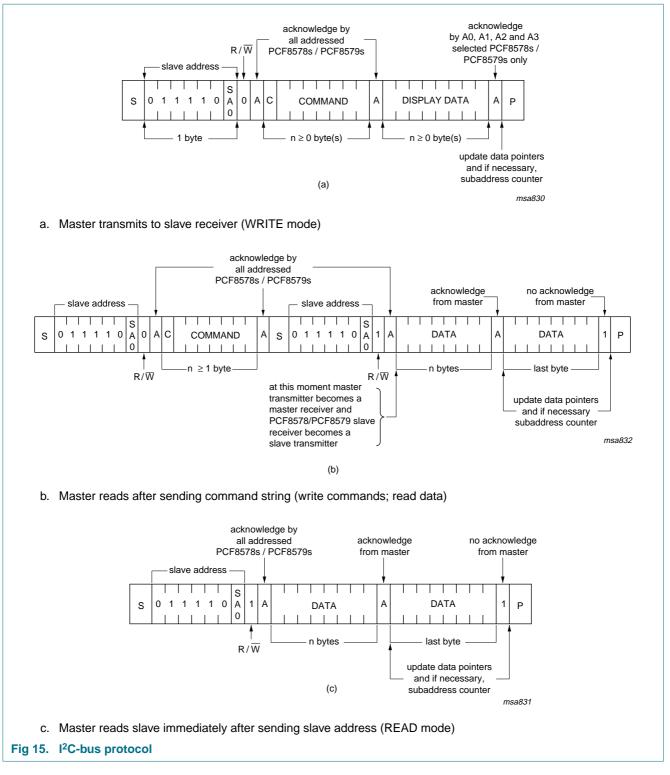

The I²C-bus protocol is shown in <u>Figure 15</u>. All communications are initiated with a START condition (S) from the I²C-bus master, which is followed by the desired slave address and read/write bit. All devices with this slave address acknowledge in parallel. All other devices ignore the bus transfer.

In WRITE mode (indicated by setting the read/write bit LOW) one or more commands follow the slave address acknowledgement. The commands are also acknowledged by all addressed devices on the bus. The last command must clear the continuation bit C. After the last command a series of data bytes may follow. The acknowledgement after each byte is made only by the (A0, A1, A2 and A3) addressed PCF8579 or PCF8578 with its implicit subaddress 0. After the last data byte has been acknowledged, the I²C-bus master issues a STOP condition (P).

NXP Semiconductors

PCF8578

LCD row/column driver for dot matrix graphic displays

In READ mode, indicated by setting the read/write bit HIGH, data bytes may be read from the RAM following the slave address acknowledgement. After this acknowledgement the master transmitter becomes a master receiver and the PCF8578 becomes a slave transmitter. The master receiver must acknowledge the reception of each byte in turn. The

master receiver must signal an end of data to the slave transmitter, by not generating an acknowledge on the last byte clocked out of the slave. The slave transmitter then leaves the data line HIGH, enabling the master to generate a STOP condition (P).

Display bytes are written into, or read from the RAM at the address specified by the data pointer and subaddress counter. Both the data pointer and subaddress counter are automatically incremented, enabling a stream of data to be transferred either to, or from the intended devices.

In multiple device applications, the hardware subaddress pins of the PCF8579s (A0 to A3) are connected to V_{SS} or V_{DD} to represent the desired hardware subaddress code. If two or more devices share the same slave address, then each device **must** be allocated to a unique hardware subaddress.

8.9 Display RAM

The PCF8578 contains a 32 × 40-bit static RAM which stores the display data. The RAM is divided into 4 banks of 40 bytes ($4 \times 8 \times 40$ bits). During RAM access, data is transferred to and from the RAM via the l²C-bus. The first eight columns of data (0 to 7) cannot be displayed but are available for general data storage and provide compatibility with the PCF8579. There is a direct correspondence between X-address and column output number.

8.9.1 Data pointer

The addressing mechanism for the display RAM is realized using the data pointer. This allows an individual data byte or a series of data bytes to be written into, or read from, the display RAM, controlled by commands sent on the I²C-bus.

8.9.2 Subaddress counter

The storage and retrieval of display data is dependent on the content of the subaddress counter. Storage takes place only when the contents of the subaddress counter match with the hardware subaddress. The hardware subaddress of the PCF8578, valid in mixed mode only, is fixed at 0000.

8.10 Command decoder

The command decoder identifies command bytes that arrive on the I²C-bus.

The five commands available to the PCF8578 are defined in Table 9.

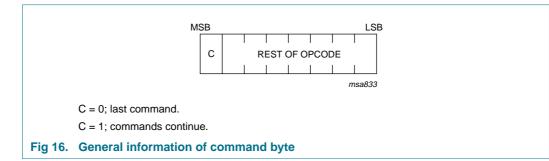

Command	Oper	Operation code						Reference	
Bit	7	6	5	4	3	2	1	0

	Symbol C -	Symbol Value C 0, 1 - 0			

[1] Values shown in decimal.

8.11 RAM access

RAM operations are only possible when the PCF8578 is in mixed mode. In this event its hardware subaddress is internally fixed at 0000 and the hardware subaddresses of any PCF8579 used in conjunction with the PCF8578 must start at 0001.

There are three RAM-access modes:

- Character
- Half-graphic
- Full-graphic

These modes are specified by the bits G[1:0] of the RAM-access command. The RAM-access command controls the order in which data is written to or read from the RAM (see Figure 18).

To store RAM data, the user specifies the location into which the first byte will be loaded (see Figure 19):

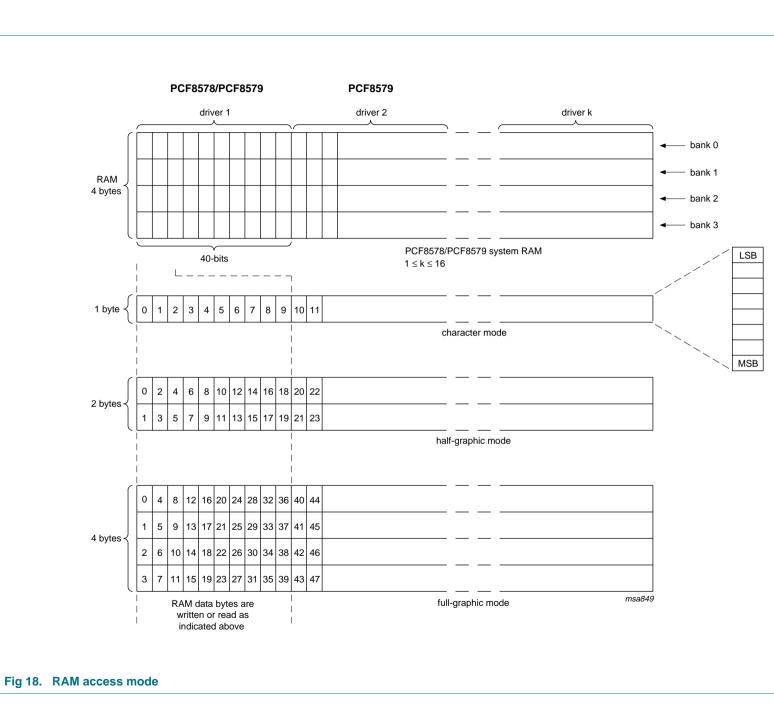

- Device subaddress (specified by the device-select command)
- RAM X-address (specified by the bits X[5:0] of the load-X-address command) •
- RAM bank (specified by the bits Y[1:0] of the RAM-access command)

Subsequent data bytes will be written or read according to the chosen RAM-access mode. Device subaddresses are automatically incremented between devices until the last device is reached. If the last device has subaddress 15, further display data transfers will lead to a wrap-around of the subaddress to 0.

8.12 Display control

The display is generated by continuously shifting rows of RAM data to the dot matrix LCD via the column outputs. The number of rows scanned depends on the multiplex rate set by bits M[1:0] of the set-mode command.

The display status (all dots on or off and normal or inverse video) is set by the bits E[1:0] of the set-mode command. For bank switching, the RAM bank corresponding to the top of the display is set by the bits B[1:0] of the set-start-bank command. This is shown in Figure 20. This feature is useful when scrolling in alphanumeric applications.

Po	output power		-	100	mW
T _{stg}	storage temperature		<u>[1]</u> –65	+150	°C

 According to the NXP store and transport conditions (document SNW-SQ-623) the devices have to be stored at a temperature of +5 °C to +45 °C and a humidity of 25 % to 75 %.

10. Static characteristics

Table 17. Static characteristics

 V_{DD} = 2.5 V to 6 V; V_{SS} = 0 V; V_{LCD} = V_{DD} - 3.5 V to V_{DD} - 9 V; T_{amb} = -40 °C to +85 °C; unless otherwise specified.

Symbol	Parameter	Conditions		Min	Тур	Max	Unit
Supplies							
V _{DD}	supply voltage			2.5	-	6.0	V
V _{LCD}	LCD supply voltage			$V_{DD}-9$	-	$V_{DD}-3.5$	V
I _{DD}	supply current	external clock;	[1]	-	6	15	μA
		$f_{clk} = 2 \text{ kHz}$					
		internal clock;		-	20	50	μΑ
		$R_{ext(OSC)} = 330 \text{ k}\Omega$					
V _{POR}	power-on reset voltage		[2]	0.8	1.3	1.8	V
Logic							
VIL	LOW-level input voltage			V _{SS}	-	$0.3V_{DD}$	V
VIH	HIGH-level input voltage			$0.7V_{DD}$	-	V _{DD}	V
I _{OL}	LOW-level output current	at pins SYNC and CLK; V _{OL} = 1 V; V _{DD} = 5 V		1	-	-	mA
		at pin SDA;		3	-	-	mA
		$V_{OL} = 0.4 \text{ V}; V_{DD} = 5 \text{ V}$					
I _{OH}	HIGH-level output current	at pins <u>SYNC</u> and CLK; V _{OH} = 4 V; V _{DD} = 5 V;		-	-	-1	mA
IL	leakage current	at pins SDA, SCL, SYNC , CLK, TEST and SA0; V _i = V _{DD} or V _{SS}		–1	-	+1	mA
		at pin OSC; V _i = V _{DD}		-1	-	+1	μA
Ci	capacitance for each I/O pin		[3]	-	-	5	pF
LCD outpu	ıts						
IL	leakage current	at pins V ₂ to V ₅ ; V _i = V _{DD} or V _{LCD}		-2	-	+2	μA
V _{offset(DC)}	DC offset voltage	on pins R0 to R7, R8/C8 to R31/C31 and C32 to C39		-	±20	-	mV
R _O	output resistance	on row output pins: R0 to R7 and R8/C8 to R31/C31	[4]	-	1.5	3	kΩ
		on column output pins: R8/C8 to R31/C31 and C32 to C39	<u>[4]</u>	-	3	6	kΩ

[1] Outputs are open; inputs at V_{DD} or V_{SS} ; I²C-bus inactive; external clock with 50 % duty factor.

[2] Resets all logic when $V_{DD} < V_{POR}$.

[3] Periodically sampled; not 100 % tested.

[4] Resistance measured between output terminal (R0 to R7, R8/C8 to R31/C31 and C32 to C39) and bias input (V_2 to V_5 , V_{DD} and V_{LCD}) when the specified current flows through one output under the following conditions (see <u>Table 6 on page 11</u>):

a) $V_{oper} = V_{DD} - V_{LCD} = 9 V.$

b) Row mode, R0 to R7 and R8/C8 to R31/C31: $V_2 - V_{LCD} \ge 6.65$ V; $V_5 - V_{LCD} \le 2.35$ V; $I_{load} = 150 \ \mu$ A.

c) Column mode, R8/C8 to R31/C31 and C32 to C39: V₃ – V_{LCD} \ge 4.70 V; V₄ – V_{LCD} \le 4.30 V; I_{load} = 100 μ A.

11. Dynamic characteristics

Table 18. Dynamic characteristics

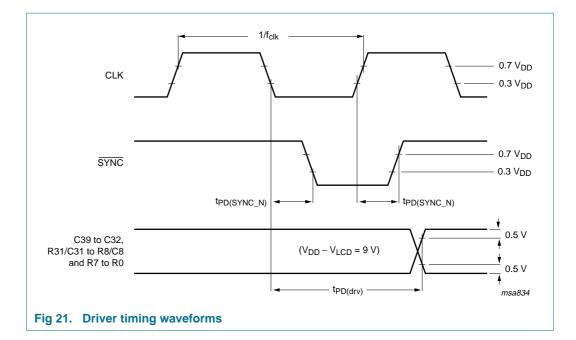

All timing values are referenced to V_{IH} and V_{IL} levels with an input voltage swing of V_{SS} to V_{DD} . $V_{DD} = 2.5 V$ to 6 V; $V_{SS} = 0 V$; $V_{LCD} = V_{DD} - 3.5 V$ to $V_{DD} - 9 V$; $T_{amb} = -40 \degree C$ to $+85 \degree C$; unless otherwise specified.

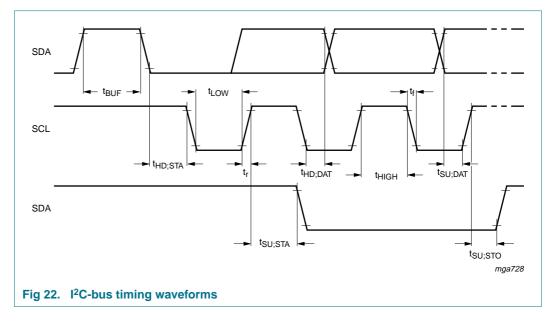

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
f _{clk}	clock frequency	at multiplex rate 1:8, 1:16 and 1:32; $R_{ext(OSC)} = 330 \text{ k}\Omega;$ $V_{DD} = 6 \text{ V}$	1.2	2.1	3.3	kHz
		at multiplex rate 1:24; $R_{ext(OSC)} = 330 \text{ k}\Omega;$ $V_{DD} = 6 \text{ V}$	0.9	1.6	2.5	kHz
t _{PD(SYNC_N)}	SYNC propagation delay		-	-	500	ns
t _{PD(drv)}	driver propagation delay	$V_{DD} - V_{LCD} = 9 V;$ with test load of 45 pF	-	-	100	μs
l ² C-bus						
f _{SCL}	SCL clock frequency		-	-	100	kHz
t _{w(spike)}	spike pulse width		-	-	100	ns
t _{BUF}	bus free time between a STOP and START condition		4.7	-	-	μs
t _{SU;STA}	set-up time for a repeated START condition		4.7	-	-	μs
t _{HD;STA}	hold time (repeated) START condition		4.0	4.0	-	μs
t _{LOW}	LOW period of the SCL clock		4.7	-	-	μs
t _{HIGH}	HIGH period of the SCL clock		4.0	-	-	μs
t _r	rise time of both SDA and SCL signals		-	-	1	μs
t _f	fall time of both SDA and SCL signals		-	-	0.3	μs
t _{SU;DAT}	data set-up time		250	-	-	ns
t _{HD;DAT}	data hold time		0	-	-	ns
t _{SU:STO}	set-up time for STOP condition		4.0	-	-	μs

14. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

14.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

14.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- · Package footprints, including solder thieves and orientation
- · The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

14.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- · Solder bath specifications, including temperature and impurities

14.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see <u>Figure 32</u>) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with Table 19 and 20

Table 19. SnPb eutectic process (from J-STD-020C)

Package thickness (mm)	Package reflow temperature (°C)			
	Volume (mm ³)			
	< 350	≥ 350		
< 2.5	235	220		
≥ 2.5	220	220		

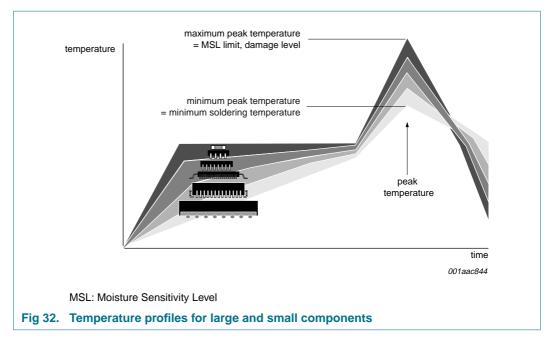

Table 20. Lead-free process (from J-STD-020C)

Package thickness (mm)					
	Volume (mm ³)				
	< 350	350 to 2000	> 2000		
< 1.6	260	260	260		
1.6 to 2.5	260	250	245		
> 2.5	250	245	245		

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see Figure 32.

LCD row/column driver for dot matrix graphic displays

For further information on temperature profiles, refer to Application Note AN10365 "Surface mount reflow soldering description".

15. Abbreviations

Table 21.	Abbreviations
Acronym	Description
CMOS	Complementary Metal Oxide Semiconductor
DC	Direct Current

MSB	Most Significant Bit
MSL	Moisture Sensitivity Level
PCB	Printed-Circuit Board
POR	Power-On Reset
RC	Resistance-Capacitance
RAM	Random Access Memory
RMS	Root Mean Square
SCL	Serial Clock Line
SDA	Serial Data Line
SMD	Surface Mount Device

16. Revision history

Document ID	Release date	Data sheet status	Change notice	Supersedes		
PCF8578_6	20090505	Product data sheet	-	PCF8578_5		
Modifications:	 The format of this data sheet has been redesigned to comply with the new identity guidelines of NXP Semiconductors. 					
	 Legal texts have been adapted to the new company name where appropriate. 					
	 Added package type TQFP64 (PCF8578HT/1) 					
	Removed bare die types					
	 Rearranged information in data sheet 					
	 Corrected values for 1:32 multiplex mode in <u>Table 4</u> 					
	 Changed letter symbols to NXP approved symbols 					
	 Added RAM addressing scheme (Figure 17) 					
PCF8578_5	20030414	Product specification	-	PCF8578_4

17. Legal information

17.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

17.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

17.3 Disclaimers

General — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in medical, military, aircraft, space or life support equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) may cause permanent damage to the device. Limiting values are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of this document is not implied. Exposure to limiting values for extended periods may affect device reliability.

Terms and conditions of sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, including those pertaining to warranty, intellectual property rights infringement and limitation of liability, unless explicitly otherwise agreed to in writing by NXP Semiconductors. In case of any inconsistency or conflict between information in this document and such terms and conditions, the latter will prevail.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from national authorities.
