DS64BR111 Ultra Low Power 6.4 Gbps 2-Channel Repeaters with Input Equalization and Output De-Emphasis

Check for Samples: DS64BR111

FEATURES

- **Two Channel Repeater for up to 6.4 Gbps**
  - **DS64BR111 : 1x Bidirectional Lane**
- **Low 65mW/Channel (Typical) Power Consumption, with Option to Power Down Unused Channels**
- **Advanced Signal Conditioning Features**
  - **Receive Equalization up to +25 dB**
  - **Transmit De-Emphasis up to -12 dB**
  - **Transmit VOD Control: 700 to 1200 mVp-p**
  - **< 0.2 UI of Residual DJ at 6.4 Gbps**
- **Programmable via Pin Selection, EEPROM or SMBus Interface**
- **Single Supply Operation Selectable: 2.5V or 3.3v**
- **Flow-Thru Pinout in 4mmx4mm 24-Pin Leadless WQFN Package**
- **>5kV HBM ESD Rating**
- **Industrial -40 to 85°C Operating Temperature Range**

APPLICATIONS

- **High-Speed Active Copper Cable Modules and FR-4 Backplane in Communication Systems**
- **FC, SAS, SATA 3/6 Gbps (with OOB Detection), InfiniBand, CPRI, OBSAI, RXAUI and Many Others**

DESCRIPTION

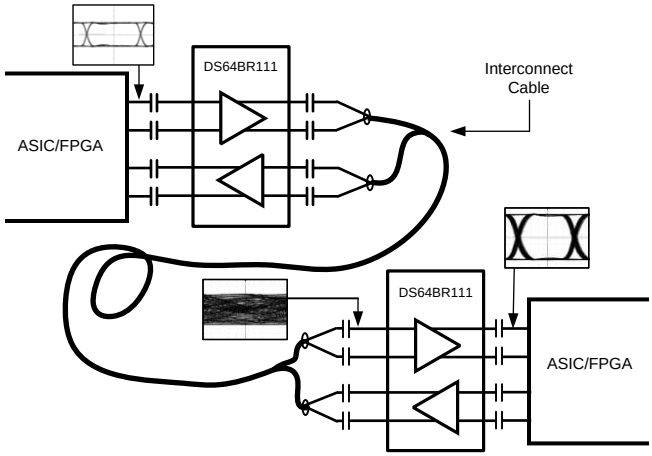
The DS64BR111 is an extremely low power, high performance dual-channel repeater for serial links with data rates up to 6.4 Gbps. The DS64BR111 pinout is configured as one bidirectional lane (one transmit, one receive channel).

The DS64BR111 features a powerful 4-stage continuous time linear equalizer (CTLE) to provide a boost of up to +25 dB at 3.2 GHz and open an input eye that is completely closed due to inter-symbol interference (ISI) induced by the interconnect mediums such as an FR-4 backplane or AWG-30 cables. The transmitter features a programmable output de-emphasis driver with up to -12 dB and allows amplitude voltage levels to be selected from 700 mVp-p to 1200 mVp-p to suit multiple application scenarios.

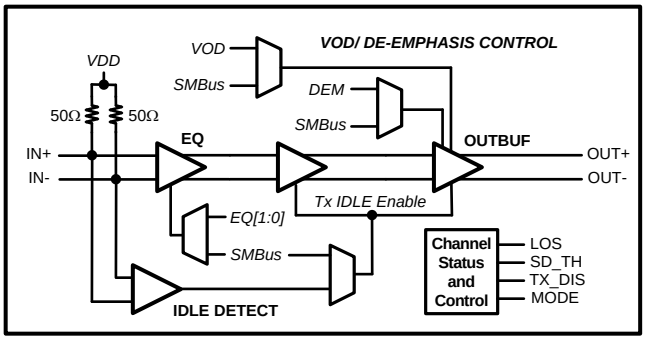
The programmable settings can be applied via pin settings, SMBus (I2C) protocol or an external EEPROM. When operating in the EEPROM mode, the configuration information is automatically loaded on power up – This eliminates the need for an external microprocessor or software driver.

Part of TI's PowerWise family of energy efficient devices, the DS64BR111 consumes just 65 mW/channel (typical), and allow the option to turn-off unused channels. This ultra low power consumption eliminates the need for external heat sinks and simplifies thermal management in active cable applications.

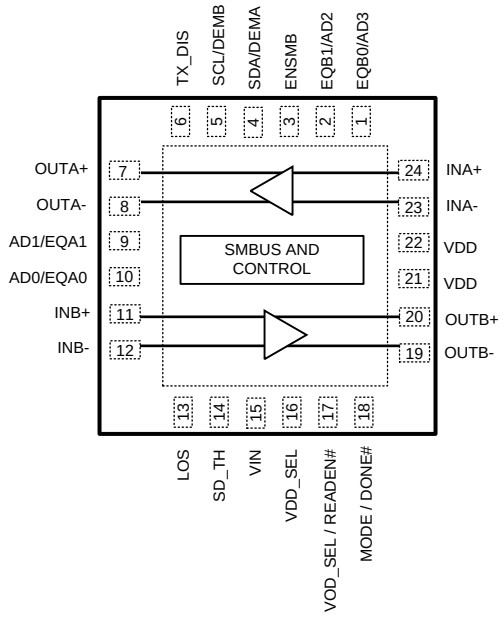
Typical Application



Block Diagram - Detail View Of Channel (1 Of 2)



Pin Diagram



(1) The center DAP on the package bottom is the device GND connection. This pad must be connected to GND through multiple (minimum of 4) vias to ensure optimal electrical and thermal performance.

DS64BR111 Pin Diagram 24 lead

PIN DESCRIPTIONS

Pin Name	Pin Number	I/O, Type[1]	Pin Description
Differential High Speed I/O's			
INA+, INA- , INB+, INB-,	24, 23 11, 12	I, CML	Inverting and non-inverting CML differential inputs to the equalizer. An on-chip 50Ω termination resistor connects INx+ to VDD and INx- to VDD when enabled.
OUTA+, OUTA-, OUTB+, OUTB-,	7, 8 20, 19	O,CML	Inverting and non-inverting 50Ω driver outputs with de-emphasis. Compatible with AC coupled CML inputs.
Control Pins			
ENSMB	3	I, LVCMOS Float	System Management Bus (SMBus) enable pin Tie HIGH = Register Access, SMBus Slave mode FLOAT = SMBus Master read from External EEPROM Tie LOW = External Pin Control Mode
ENSMB = 1 (SMBUS MODE)			
SCL	5	I, LVCMOS O, Open Drain	ENSMB Master or Slave mode SMBUS clock input pin is enabled. A clock input in Slave mode. Can also be a clock output in Master mode.
SDA	4	I, LVCMOS, O, OPEN Drain	ENSMB Master or Slave mode The SMBus bidirectional SDA pin is enabled. Data input or open drain (pull-down only) output.

(1) LVCMOS inputs without the “Float” conditions must be driven to a logic low or high at all times or operation is not specified. Unless the "Float" level is desired; 4-Level input pins require a minimum 1K resistor to GND, VDD (in 2.5V mode), or VIN (in 3.3V mode). For additional information, Table 1 Table 5
Input edge rate for LVCMOS/FLOAT inputs must be faster than 50 ns from 10–90%

PIN DESCRIPTIONS (continued)

Pin Name	Pin Number	I/O, Type[1]	Pin Description
AD0-AD3	10, 9, 2, 1	I, LVCMOS Float (4-Levels)	ENSMB Master or Slave mode SMBus Slave Address Inputs. In SMBus mode, these pins are the user set SMBus slave address inputs. There are 16 addresses supported by these pins. Pins must be tied LOW or HIGH when used to define the device SMBus address. **Note: Setting VOD_SEL = High in SMBus Mode will force the Address = B0'h**
READEN#	17	I, LVCMOS	When using an External EEPROM, a transition from high to low starts the load from the external EEPROM
DONE#	18	IO, LVCMOS, Float (4-Levels)	EEPROM Download Status HIGH indicates Error / Still Loading LOW indicates download complete. No Error.
ENSMB = 0 (PIN MODE)			
EQA0, EQA1 EQB0, EQB1	10, 9 1, 2	I, LVCMOS, Float (4-Levels)	EQA/B ,0/1 control the level of equalization of each channel. The EQA/B pins are active only when ENSMB is de-asserted (LOW). When ENSMB goes high the SMBus registers provide independent control of each lane, and the EQB0/B1 pins are converted to SMBUS AD2/AD3 inputs.
DEMA, DEMB	4, 5	IO, LVCMOS, Float (4-Levels)	DEMA/B controls the level of de-emphasis. The DEMA/B pins are only active when ENSMB is de-asserted (LOW). Each of the 4 A/B channels have the same level unless controlled by the SMBus control registers. When ENSMB goes high the SMBus registers provide independent control of each lane and the DEM pins are converted to SMBUS SCL and SDA pins.
TX_DIS	6	I, LVCMOS	DS64BR111 High = OUTA Enabled / OUTB Disabled Low = OUTA/B Enabled
VOD_SEL	17	I, LVCMOS, Float (4-Levels)	EQ Mode and VOD select. High = (VOD = 1.1V/1.3V) Float = (VOD = 1.0 V) 20K = (VOD = 1.2 V) Low = (VOD = 700m V) **Note: DS64BR111 OUTA is limited to 700mV in pin mode, see Table 4 for additional information.** **Note: Setting VOD_SEL = High in SMBus Mode will force the SMBus Address = B0'h**
VDD_SEL	16	I, Internal Pull-up	Enables the 3.3V to 2.5V internal regulator Low = 3.3 V Operation Float = 2.5 V Operation
MODE	18	I, LVCMOS	Controls Device Mode of Operation High = Continuous Talk Float = Slow OOB 20KΩ = eSATA Mode, Fast OOB, Auto Low Power on 100 uS of inactivity. SD stays active. Low = SAS Mode, Fast OOB
Status Output			
LOS	13	O, Open Drain	Indicates Loss of Signal (Default is LOS on INA). Can be modified via SMBus registers.
LOS Threshold Input			
SD_TH	14	I, LVCMOS, Float (4-Levels)	The SD_TH pin controls LOS threshold setting; Assert (mV), Deassert (mV) 20K = 160 mV, 100 mV Float = 180 mV, 110 mV (Default) High = 190 mV, 130 mV Low = 210 mV, 150 mV **Note: Using values less than the default level can extend the time required to detect LOS and are not recommended.**
Power			

PIN DESCRIPTIONS (continued)

Pin Name	Pin Number	I/O, Type[1]	Pin Description
VDD	21, 22	Power	Power supply pins 2.5V mode connect to 2.5V 3.3V mode do not connect to any supply voltage. Should be used to attach external decoupling to device. 100 - 200 nF recommended. **Note: See APPLICATION INFORMATION for additional information.**
VIN	15	Power	VIN = 3.3V +/-10% (input to internal LDO regulator) **Note: Must FLOAT for 2.5V operation. See APPLICATION INFORMATION for additional information.**
GND	DAP	Power	Ground pad (DAP - die attach pad).

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS[1][2]

Supply Voltage (VDD)	-0.5V to +2.75V
Supply Voltage (VIN)	-0.5V to +4.0V
LVCMOS Input/Output Voltage	-0.5V to +4.0V
CML Input Voltage	-0.5V to (VDD+0.5)
CML Input Current	-30 to +30 mA
Junction Temperature	125°C
Storage Temperature	-40°C to +125°C
ESD Rating	
HBM, STD - JESD22-A114F	> 5 kV
MM, STD - JESD22-A115-A	100 V
CDM, STD - JESD22-C101-D	1250 V
Package Thermal Resistance	
θJC	3.2°C/W
θJA, No Airflow, 4 layer JEDEC	33.0°C/W
For soldering specifications: See product folder at www.ti.com http://www.ti.com/lit/SNOA549	

(1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions. Absolute Maximum Numbers are specified for a junction temperature range of -40°C to +125°C. Models are validated to Maximum Operating Voltages only.

(2) **If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office / Distributors for availability and specifications.**

RECOMMENDED OPERATING CONDITIONS

	Min	Typ	Max	Units
Supply Voltage (2.5V Mode)	2.375	2.5	2.625	V
Supply Voltage (3.3V Mode)	3.0	3.3	3.6	V
Ambient Temperature	-40	25	+85	°C
SMBus (SDA, SCL)			3.6	V

ELECTRICAL CHARACTERISTICS

Symbol	Parameter	Conditions	Min	Typ	Max	Units

FUNCTIONAL DESCRIPTION

The DS64BR111 is a high performance circuit capable of delivering excellent performance. Careful attention must be paid to the details associated with high-speed design as well as providing a clean power supply. Refer to the information below and Revision 4 of the LVDS Owner's Manual for more detailed information on high speed design tips to address signal integrity design issues.

The control pins have been enhanced to have 4 different levels and provide a wider range of control settings. Refer to Table 1

Table 1. 4-Level Control Pin Settings

Pin Setting	Description
0	Tie pin to GND through a 1 KΩ resistor
R	Tie pin to ground through 20 KΩ resistor
Float	Float the pin (no connection)
1	Tie pin to VDD through a 1 KΩ resistor

Note: 4-Level IO pins require a 1K resistance to GND or VDD/VIN. It is possible to tie mulitple 4-level IO pins together with a single resistor to GND or VDD/VIN. When multiple IOs are connected in parallel, the resistance to GND or VDD/VIN should be adjusted to compensate. For 2 pins the optimal resistance is 500 Ohms, 3 pins = 330 Ohms, and 4 pins = 250 Ohms.

Note: For 2.5V mode the control pin logic 1 level is VDD (pins 21 and 22), in 3.3V mode the control pin logic 1 level is defined by VIN (pin 15).

Table 2. Equalizer Settings

Level	EQA1/EQB1	EQA0/EQB0	EQ — 8 bits [7:0]	dB Boost at 3.2 Ghz	Suggested Media
1	0	0	0000 0000 = 0x00	3.7	FR4 < 5 inch trace
2	0	R	0000 0001 = 0x01	6.0	FR4 5 inch trace
3	0	Float	0000 0010 = 0x02	7.5	FR4 10 inch trace
4	0	1	0000 0011 = 0x03	8.5	FR4 15 inch trace
5	R	0	0000 0111 = 0x07	11	FR4 20 inch trace
6	R	R	0001 0101 = 0x15	12	FR4 25 inch trace
7	R	Float	0000 1011 = 0x0B	14	FR4 25 inch trace
8	R	1	0000 1111 = 0x0F	15	7m 30AWG Cable
9	Float	0	0101 0101 = 0x55	15	FR4 30 inch trace
10	Float	R	0001 1111 = 0x1F	18	8m 30 AWG Cable FR4 35 inch trace
11	Float	Float	0010 1111 = 0x2F	20	10m 30 AWG Cable
12	Float	1	0011 1111 = 0x3F	22	10m - 12m, Cable
13	1	0	1010 1010 = 0xAA	23	
14	1	R	0111 1111 = 0x7F	25	
15	1	Float	1011 1111 = 0xBF	27	
16	1	1	1111 1111 = 0xFF	28	

Note: Settings are approximate and will change based on PCB material, trace dimensions, and driver waveform characteristics.

Table 3. De-emphasis and Output Voltage Settings

Level	VOD_SEL	DEMA/B	SMBus Register DEM Level	SMBus Register VOD Level	VOD (mV)	DEM (dB)
1	0	0	000	000	700	0
2	0	Float	010	000	700	- 3.5
3	0	R	011	000	700	- 6
4	0	1	101	000	700	- 9
5	Float	0	000	011	1000	0

Table 3. De-emphasis and Output Voltage Settings (continued)

6	Float	Float	010	011	1000	- 3.5
7	Float	R	011	011	1000	- 6
8	Float	1	101	011	1000	- 9
9	R	0	000	101	1200	- 0
10	R	Float	010	101	1200	- 3.5
11	R	R	011	101	1200	- 6
12	R	1	101	101	1200	- 9
13	1	0	000	100	1100	0
14	1	Float	001	100	1100	- 1.5
15	1	R	001	110	1300	- 1.5
16	1	1	010	110	1300	- 3.5

Note: The DS64BR111 VOD for OUTPUT A is limited to 700 mV in pin mode (ENSMB=0). With ENSMB = 1 or FLOAT, the VOD for OUTPUT A can be adjusted with SMBus register 0x23 [4:2] as shown in the SMBus Register Table.

Note: In SMBus Mode if VOD_SEL is in the Logic 1 state (1K resistor to VIN/VDD) the DS64BR111 AD0-AD3 pins are internally forced to 0'h

Table 4. Signal Detect Threshold Level

SD_TH	SMBus REG bit [3:2] and [1:0]	Assert Level (Typical)	De-assert Level (Typical)
0	10	210 mV	150 mV
20K to GND	01	160 mV	100 mV
Float (Default)	00	180 mV	110 mV
1	11	190 mV	130 mV
Note: VDD = 2.5V, 25°C, and 010101 pattern at 6.4 Gbps			

APPLICATION INFORMATION

4-Level Input Configuration Guidelines

The 4-level input pins utilize a resistor divider to help set the 4 valid levels. There is an internal 30K pull-up and a 60K pull-down connected to the package pin. These resistors, together with the external resistor connection combine to achieve the desired voltage level. Using the 1K pull-up, 1K pull-down, no connect, and 20K pull-down provide the optimal voltage levels for each of the four input states.

Table 5. 4-Level Input Voltage

Level	Setting	3.3V Mode	2.5V Mode
0	01K to GND	0.1 V	0.08 V
R	20K to GND	0.33 * V_{IN}	0.33 * V_{DD}
F	FLOAT	0.67 * V_{IN}	0.67 * V_{DD}
1	1K to V_{DD}/V_{IN}	V_{IN} - 0.05V	V_{IN} - 0.04V

- Typical 4-Level Input Thresholds
  - Level 1 - 2 = 0.2 V_{IN} or V_{DD}
  - Level 2 - 3 = 0.5 V_{IN} or V_{DD}
  - Level 3 - 4 = 0.8 V_{IN} or V_{DD}

In order to minimize the startup current associated with the integrated 2.5V regulator the 1K pull-up / pull-down resistors are recommended. If several 4 level inputs require the same setting, it is possible to combine two or more 1K resistors into a single lower value resistor. As an example; combining two inputs with a single 500Ω resistor is a good way to save board space.

PCB Layout Guidelines

The CML inputs and outputs have been optimized to work with interconnects using a controlled differential impedance of 85 - 100Ω. It is preferable to route differential lines exclusively on one layer of the board, particularly for the input traces. The use of vias should be avoided if possible. If vias must be used, they should be used sparingly and must be placed symmetrically for each side of a given differential pair. Whenever differential vias are used the layout must also provide for a low inductance path for the return currents as well. Route the differential signals away from other signals and noise sources on the printed circuit board. See AN-1187 (SNOA401) for additional information on WQFN packages.

Different transmission line topologies can be used in various combinations to achieve the optimal system performance. Impedance discontinuities at vias can be minimized or eliminated by increasing the swell around each hole and providing for a low inductance return current path. When the via structure is associated with thick backplane PCB, further optimization such as back drilling is often used to reduce the detrimental high frequency effects of stubs on the signal path.

Power Supply Configuration Guidelines

The DS64BR111 can be configured for 2.5V operation or 3.3V operation. The lists below outline required connections for each supply selection.

3.3V Mode of Operation

1. Tie VDD_SEL = 0 with 1K resistor to GND.
2. Feed 3.3V supply into VIN pin. Local 1.0 uF decoupling at VIN is recommended.
3. See information on VDD bypass below.
4. SDA and SCL pins should connect pull-up resistor to VIN
5. Any 4-Level input which requires a connection to "Logic 1" should use a 1K resistor to VIN

2.5V Mode of Operation

6. VDD_SEL = Float
7. VIN = Float
8. Feed 2.5V supply into VDD pins.
9. See information on VDD bypass below.

10. SDA and SCL pins connect pull-up resistor to VDD for 2.5V uC SMBus IO
11. SDA and SCL pins connect pull-up resistor to VIN for 3.3V uC SMBus IO
12. Any 4-Level input which requires a connection to "Logic 1" should use a 1K resistor to VIN

Note: The DAP (bottom solder pad) is the GND connection.

Power Supply Bypass

Two approaches are recommended to ensure that the DS64BR111 is provided with an adequate power supply. First, the supply (VDD) and ground (GND) pins should be connected to power planes routed on adjacent layers of the printed circuit board. The layer thickness of the dielectric should be minimized so that the V_{DD} and GND planes create a low inductance supply with distributed capacitance. Second, careful attention to supply bypassing through the proper use of bypass capacitors is required. A 0.1 µF bypass capacitor should be connected to each V_{DD} pin such that the capacitor is placed as close as possible to the device. Smaller body size capacitors can help facilitate proper component placement.

System Management Bus (SMBus) and Configuration Registers

The System Management Bus interface is compatible to SMBus 2.0 physical layer specification. ENSMB must be pulled high to enable SMBus mode and allow access to the configuration registers.

The DS64BR111 has AD[3:0] inputs in SMBus mode. These pins are the user set SMBus slave address inputs. When pulled low the AD[3:0] = 0000'b, the device default address byte is B0'h. Based on the SMBus 2.0 specification, this configuration results in a 7-bit slave address of 1011000'b. The LSB is set to 0'b (for a WRITE), thus the 8-bit value is 1011 0000'b or B0'h. The device address byte can be set with the use of the AD[3:0] inputs.

Shown in the form of an expression:

Slave Address [7:4] = The DS64BR111 hardware address (1011'b) + Address pin AD[3]

Slave Address [3:1] = Address pins AD[2:0]

Slave Address [0] = 0'b for a WRITE or 1'b for a READ

Slave Address Examples:

- AD[3:0] = 0001'b, the device slave address byte is B2'h
  - Slave Address [7:4] = 1011'b + 0'b = 1011'b or B'h
  - Slave Address [3:1] = 001'b
  - Slave Address [0] = 0'b for a WRITE
- AD[3:0] = 0010'b, the device slave address byte is B4'h
  - Slave Address [7:4] = 1011'b + 0'b = 1011'b or B'h
  - Slave Address [3:1] = 010'b
  - Slave Address [0] = 0'b for a WRITE
- AD[3:0] = 0100'b, the device slave address byte is B8'h
  - Slave Address [7:4] = 1011'b + 0'b = 1011'b or B'h
  - Slave Address [3:1] = 100'b
  - Slave Address [0] = 0'b for a WRITE
- AD[3:0] = 1000'b, the device slave address byte is C0'h
  - Slave Address [7:4] = 1011'b + 1'b = 1100'b or C'h
  - Slave Address [3:1] = 000'b
  - Slave Address [0] = 0'b for a WRITE

TRANSFER OF DATA VIA THE SMBus

During normal operation the data on SDA must be stable during the time when SCL is High.

There are three unique states for the SMBus:

START: A High-to-Low transition on SDA while SCL is High indicates a message START condition.

STOP: A Low-to-High transition on SDA while SCL is High indicates a message STOP condition.

IDLE: If SCL and SDA are both High for a time exceeding t_{BUF} from the last detected STOP condition or if they are High for a total exceeding the maximum specification for t_{HIGH} then the bus will transfer to the IDLE state.

SMBus TRANSACTIONS

The device supports WRITE and READ transactions. See Register Description table for register address, type (Read/Write, Read Only), default value and function information.

WRITING A REGISTER

To write a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a “0” indicating a WRITE.
2. The Device (Slave) drives the ACK bit (“0”).
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit (“0”).
5. The Host drive the 8-bit data byte.
6. The Device drives an ACK bit (“0”).
7. The Host drives a STOP condition.

The WRITE transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

READING A REGISTER

To read a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a “0” indicating a WRITE.
2. The Device (Slave) drives the ACK bit (“0”).
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit (“0”).
5. The Host drives a START condition.
6. The Host drives the 7-bit SMBus Address, and a “1” indicating a READ.
7. The Device drives an ACK bit “0”.
8. The Device drives the 8-bit data value (register contents).
9. The Host drives a NACK bit “1”indicating end of the READ transfer.
10. The Host drives a STOP condition.

The READ transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

Please see SMBus Register Map Table for more information for more information.

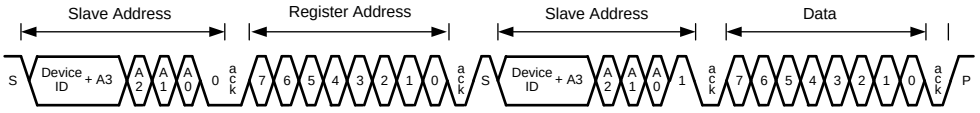

Figure 5. Typical SMBus Write Operation

EEPROM Modes in DS64BR111 Device

The DS64BR111 device supports reading directly from an external EEPROM device by implementing SMBus Master mode. When using the SMBus master mode, the DS64BR111 will read directly from specific location in the external EEPROM. When designing a system for using the external EEPROM, the user needs to follow these specific guidelines.

- Set the DS64BR111 into SMBus Master Mode
  - Float ENSMB (PIN 3)
- The external EEPROM device address byte must be 0xA0'h
- Set the AD[3:0] inputs for SMBus address byte. When the AD[3:0] = 0000'b, the device address byte is B0'h.

- Based on the SMBus 2.0 specification, a device can have a 7-bit slave address of 1011 000'b. The LSB is set to 0'b (for a WRITE). The bit mapping for SMBus is listed below:
  - [7:5] = Reserved Bits from the SMBus specification
  - [4:1] = Usable SMBus Address Bits
  - [0] = Write Bit
- The DS64BR111 devices have AD[3:0] inputs in SMBus mode (pins 1, 2, 9, 10). These pins set SMBus slave address. The AD[3:0] pins do not have any internal pull resistors. When the AD[3:0] = 0001'b, the device address byte is B2'h.
  - [7:5] = 4b'101
  - [4:1] = Address of 4'b0001
  - [0] = Write Bit, 1'b0
- The device address can be set with the use of the AD[3:0] input up to 16 different addresses. Use the example below to set each of the SMBus addresses.
  - AD[3:0] = 0001'b, the device address byte is B2'h
  - AD[3:0] = 0010'b, the device address byte is B4'h
  - AD[3:0] = 0011'b, the device address byte is B6'h
  - AD[3:0] = 0100'b, the device address byte is B8'h
- The master implementation in the DS64BR111, support multiple devices reading from 1 EEPROM. When tying multiple devices to the SDA and SCL pins, use these guidelines:
  - Use adjacent SMBus addresses for the 4 devices
  - Use a pull-up resistor on SDA; value = 4.7KΩ
  - Use a pull-up resistor on SCL: value = 4.7KΩ
  - Daisy-chain READEN# (pin 17) and DONE# (pin18) from one device to the next device in the sequence
    1. Tie READEN# of the 1st device in the chain (U1) to GND
    2. Tie DONE# of U1 to READEN# of U2
    3. Tie DONE# of U2 to READEN# of U3
    4. Tie DONE# of U3 to READEN# of U4
    5. Optional: Tie DONE# of U4 to a LED to show each of the devices have been loaded successfully

Master EEPROM Mode in the DS100BR111

Below is an example of a 2 kbits (256 x 8-bit) EEPROM in hex format for the DS100BR111 device. The first 3 bytes of the EEPROM always contain a header common and necessary to control initialization of all devices connected to the I2C bus. CRC enable flag to enable/disable CRC checking. There is a MAP bit to flag the presence of an address map that specifies the configuration data start in the EEPROM. If the MAP bit is not present the configuration data start address is derived from the DS100BR111 address and the configuration data size. A bit to indicate an EEPROM size > 256 bytes is necessary to properly address the EEPROM. There are 37 bytes of data size for each DS100BR111 device.

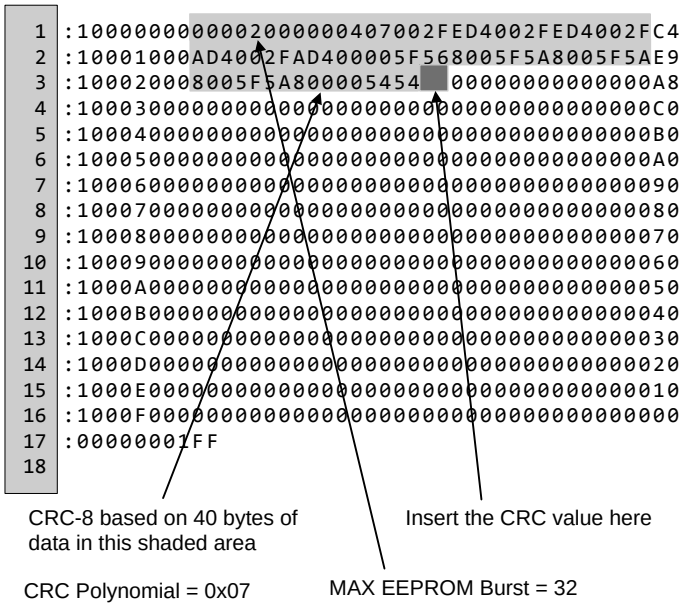

Figure 6. Typical EEPROM Data Set

The CRC-8 calculation is performed on the first 3 bytes of header information plus the 37 bytes of data for the DS64BR111 or 40 bytes in total. The result of this calculation is placed immediately after the DS64BR111 data in the EEPROM which ends with "5454". The CRC-8 in the DS64BR111 uses a polynomial = $x^8 + x^2 + x + 1$

In SMBus master mode the DS64BR111 reads its initial configuration from an external EEPROM upon power-up. Some of the pins of the DS64BR111 perform the same functions in SMBus master and SMBus slave mode. Once the DS64BR111 has finished reading its initial configuration from the external EEPROM in SMBus master mode it reverts to SMBus slave mode and can be further configured by an external controller over the SMBus. The connection to an external SMBus master is optional and can be omitted for applications were additional security is desirable. There are two pins that provide unique functions in SMBus master mode.

- DONE#
- READEN#

When the DS64BR111 is powered up in SMBus master mode, it reads its configuration from the external EEPROM when the READEN# pin goes low. When the DS64BR111 is finished reading its configuration from the external EEPROM, it drives the DONE# pin low. In applications where there is more than one DS64BR111 on the same SMBus, bus contention can result if more than one DS64BR111 tries to take control of the SMBus at the same time. The READEN# and DONE# pins prevent this bus contention. The system should be designed so that the READEN# pin from one DS64BR111 in the system is driven low on power-up. This DS64BR111 will take command of the SMBus on power-up and will read its initial configuration from the external EEPROM. When it is finished reading its configuration, it will drive the DONE# pin low. This pin should be connected to the READEN# pin of another DS64BR111. When this DS64BR111 senses its READEN# pin driven low, it will take command of the SMBus and read its initial configuration from the external EEPROM, after which it will set its DONE# pin low. By connecting the DONE# pin of each DS64BR111 to the READEN# pin of the next DS64BR111, each DS64BR111 can read its initial configuration from the EEPROM without causing bus contention.

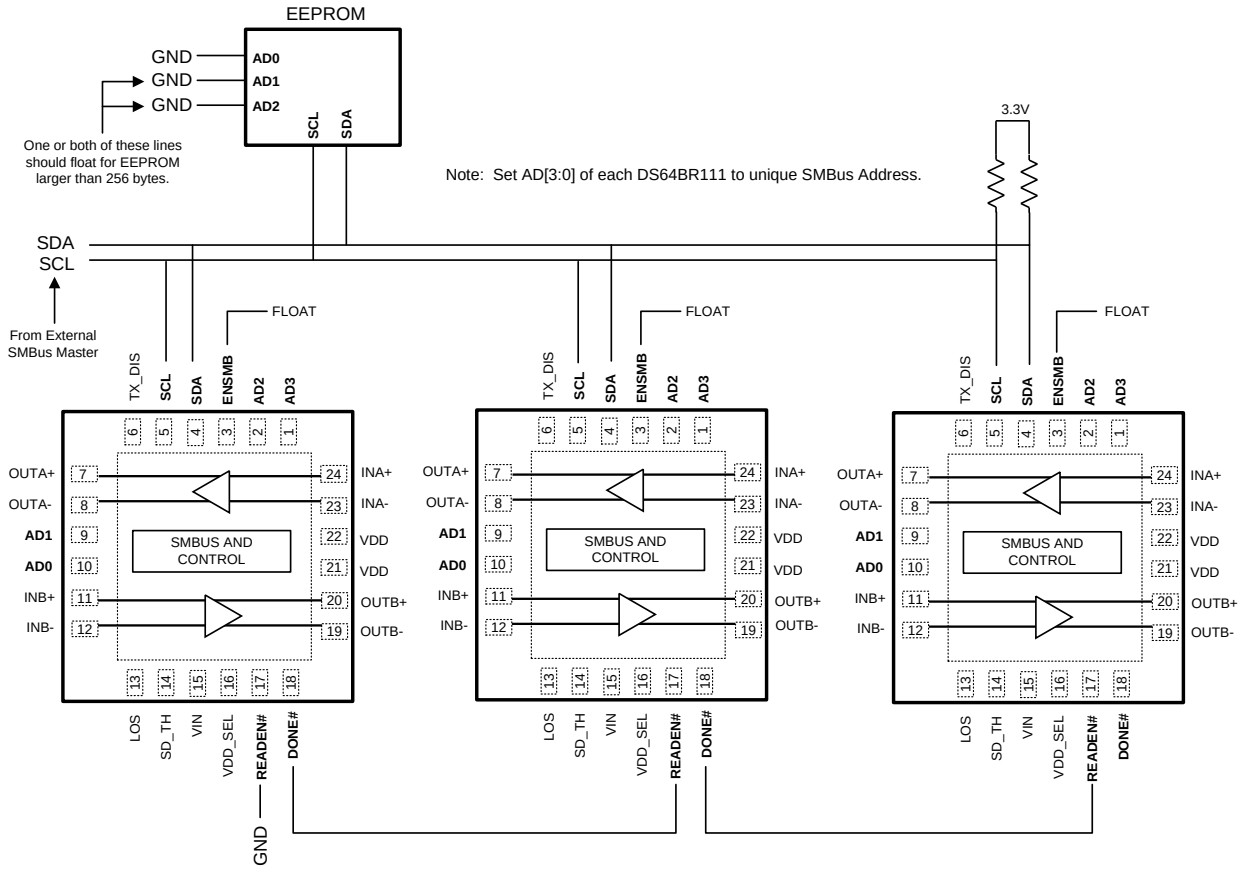

Figure 7. Typical multi-device EEPROM connection diagram

REVISION HISTORY

Changes from Revision B (April 2013) to Revision C	Page
• Changed layout of National Data Sheet to TI format	32

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DS64BR111SQ/NOPB	ACTIVE	WQFN	RTW	24	1000	Green (RoHS & no Sb/Br)	SN	Level-3-260C-168 HR	-40 to 85	64BR111	Samples
DS64BR111SQE/NOPB	ACTIVE	WQFN	RTW	24	250	Green (RoHS & no Sb/Br)	SN	Level-3-260C-168 HR	-40 to 85	64BR111	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

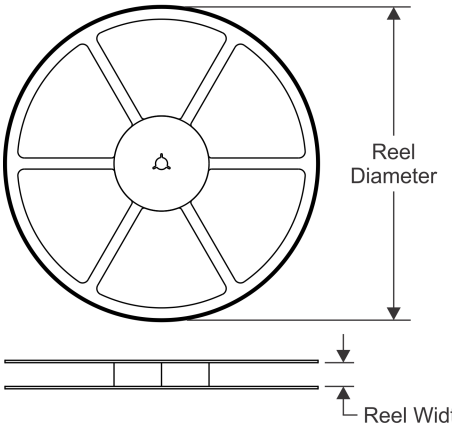
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

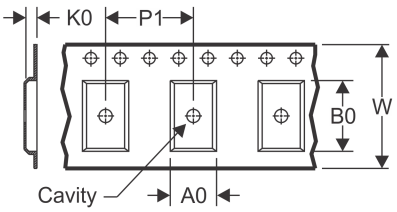
(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

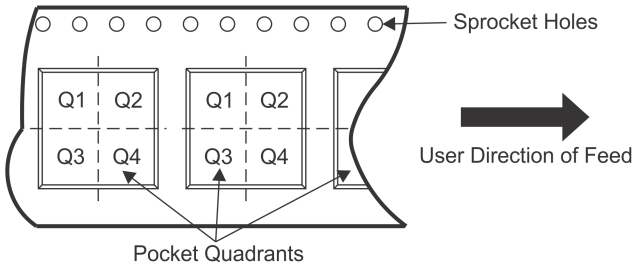


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

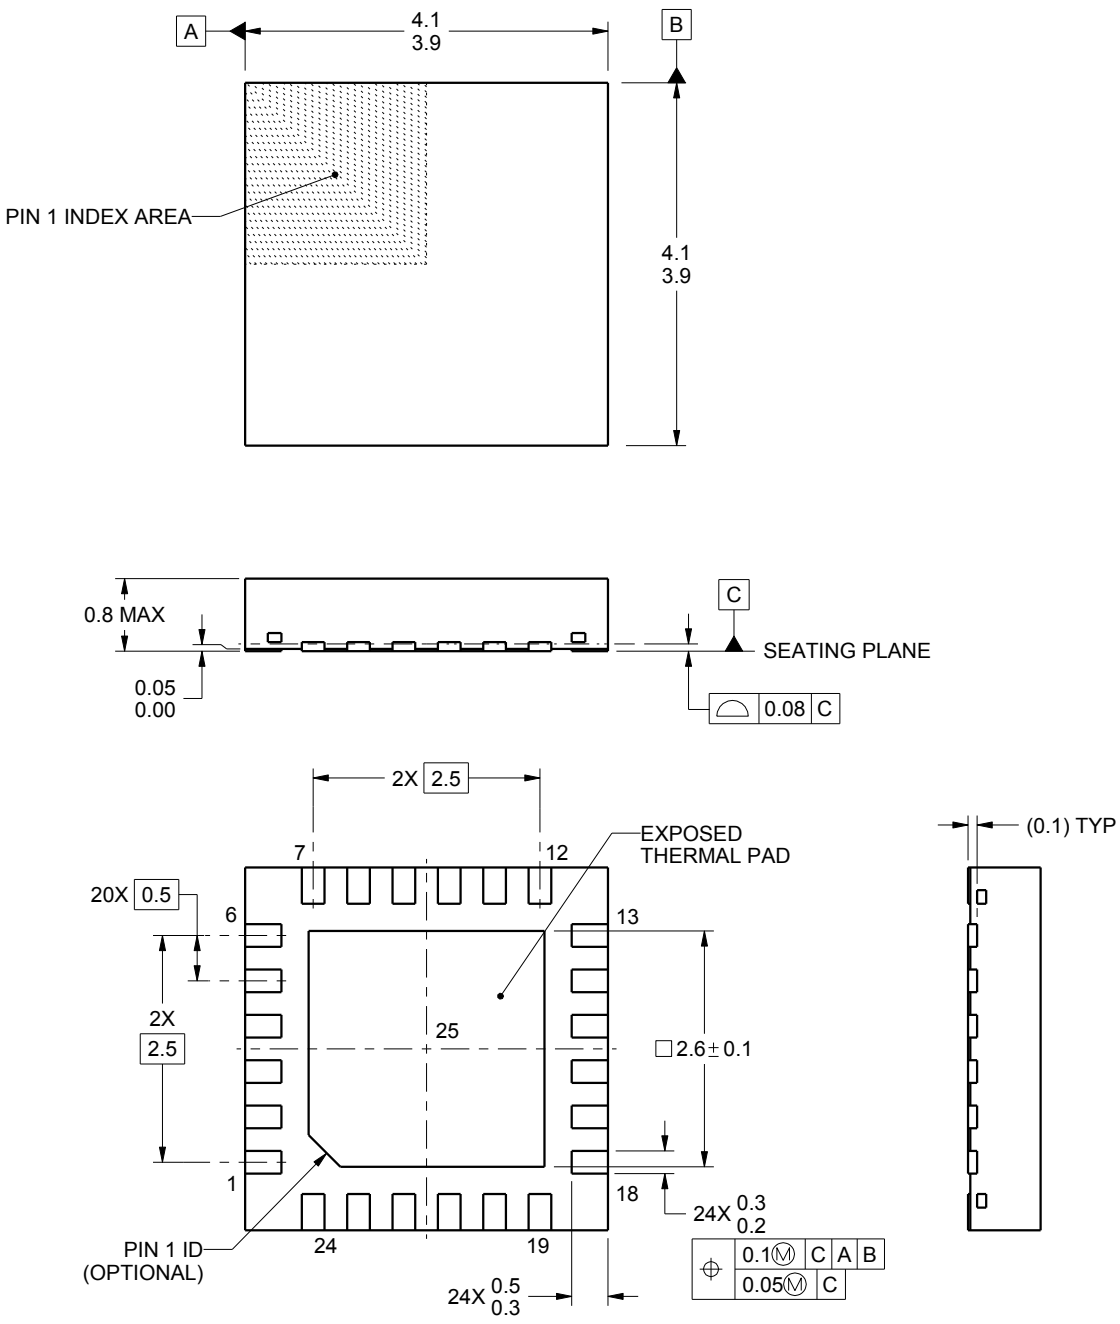
PACKAGE OUTLINE

RTW0024A

WQFN - 0.8 mm max height

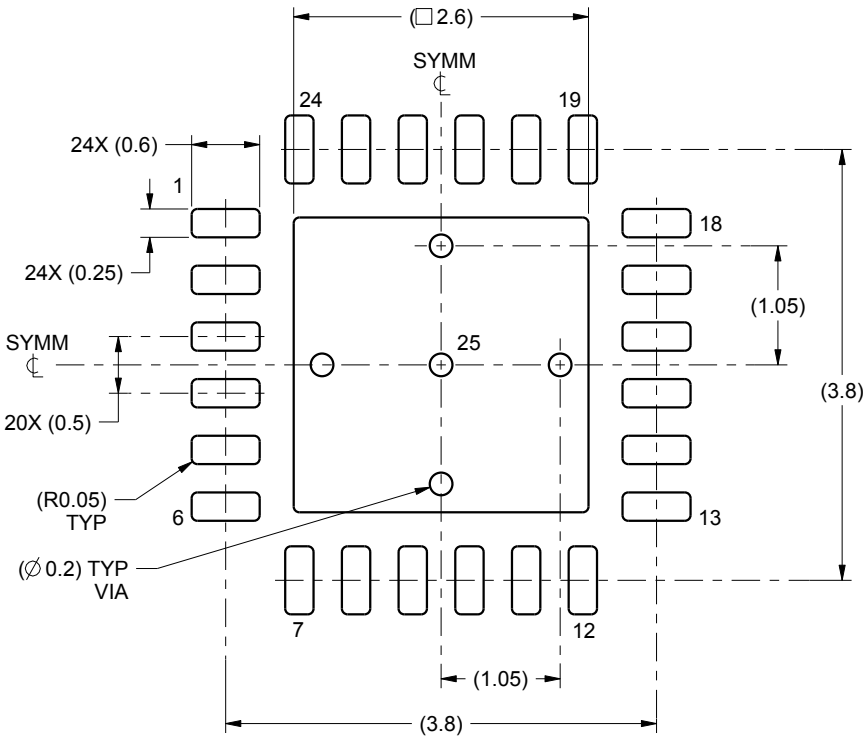
PLASTIC QUAD FLATPACK - NO LEAD



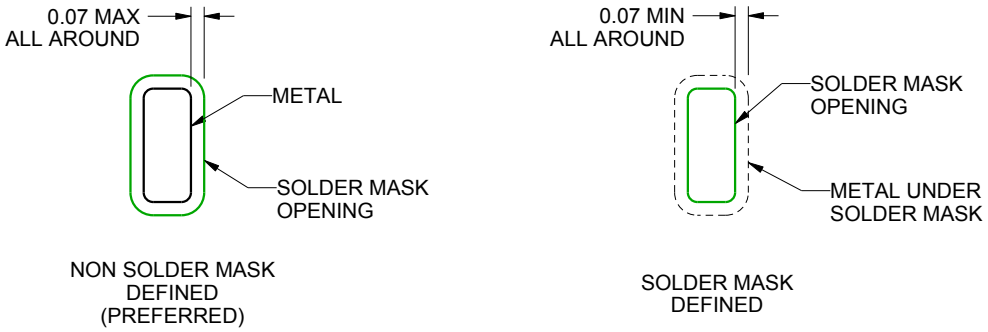
4222815/A 03/2016

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.



LAND PATTERN EXAMPLE
SCALE:15X

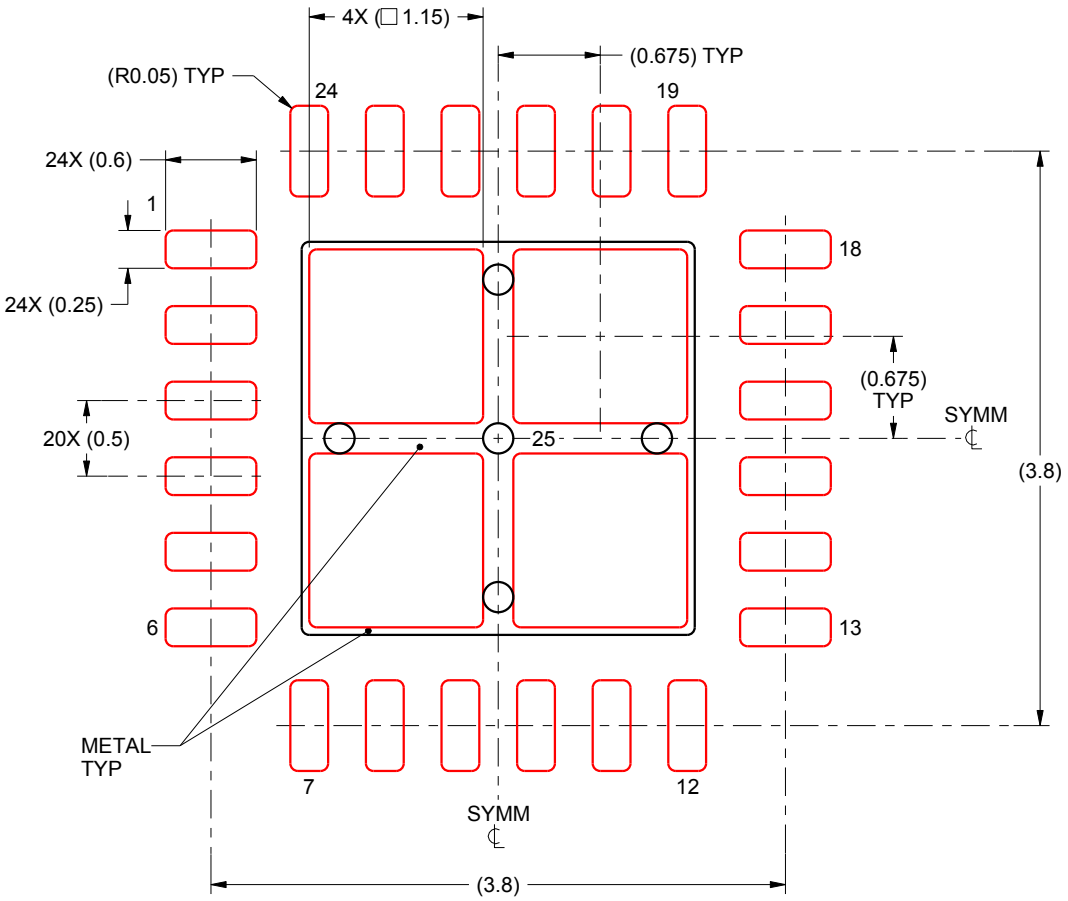


SOLDER MASK DETAILS

4222815/A 03/2016

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).



SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 25:
78% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
SCALE:20X

4222815/A 03/2016

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
