## 5 V ECL +4 Divider

#### Description

The MC10EL/100EL33 is an integrated  $\div 4$  divider. The differential clock inputs and the  $V_{BB}$  allow a differential, single-ended or AC coupled interface to the device. The  $V_{BB}$  pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to  $V_{BB}$  as a switching reference voltage.  $V_{BB}$  may also rebias AC coupled inputs. When used, decouple  $V_{BB}$  and  $V_{CC}$  via a 0.01  $\mu F$  capacitor and limit current sourcing or sinking to 0.5 mA. When not used,  $V_{BB}$  should be left open.

The reset pin is asynchronous and is asserted on the rising edge. Upon power-up, the internal flip-flops will attain a random state; the reset allows for the synchronization of multiple EL33's in a system.

The 100 Series contains temperature compensation.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

- 1. 10 Series:  $V_{EE}$  can vary +0.25 V / -0.5 V. 100 Series:  $V_{EE}$  can vary +0.8 V / -0.5 V.
- 2. V<sub>PP</sub>(min) is minimum input swing for which AC parameters guaranteed. The device has a DC gain of ≈40.
