

NCP729

200 mA Ultra-Low Noise Very-Low Iq, High PSRR, LDO Linear Voltage Regulator

The NCP729 is a 200 mA LDO suitable to provide clean analog power supply rails for noise sensitive applications. This device features Ultra-Low Noise performance, High Power Supply Rejection Ratio and Very good transient response characteristics. Very Low Dropout and Very Low Quiescent Current makes this LDO an attractive choice for wide range of battery powered, portable products. Current Limit and Thermal Shutdown provide protection during failure conditions. NCP729 is available in 1.06 mm x 1.06 mm Chip Scale Package and it is stable with small 1 μ F Ceramic capacitors.

Features

- Operating Input Voltage Range: 2.0 V to 5.5 V
- Fixed Voltage Options Available: 0.8 V to 3.5 V
- Very Low Quiescent Current: Max. 50 μ A over Temperature
- Ultra Low Noise: 10 μ V_{RMS} from 100 Hz to 100 kHz
- Very Low Dropout: 86 mV Typical at 200 mA
- $\pm 2\%$ Accuracy over Full Load, Line and Temperature Variations
- High PSRR: 72 dB at 1 kHz
- Thermal Shutdown and Current Limit Protections
- Stable with a 1 μ F Ceramic Output Capacitor
- Available in 1.06 mm x 1.06 mm 4-bump CSP Package
- Active Output Discharge for Fast Turn-Off
- These are Pb-free Devices

Typical Applications

- PDAs, Tablets, GPS, Smartphones
- Wireless Handsets, Wireless LAN, Bluetooth, Zigbee
- Portable Medical Equipment
- Other Battery Powered Applications

NCP729

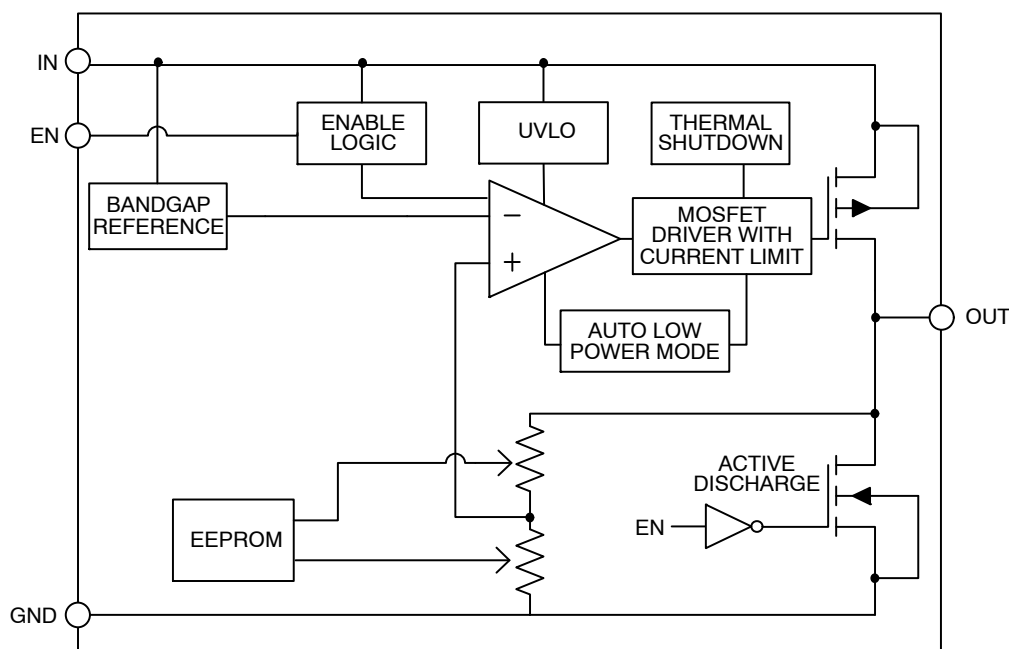

Figure 2. Simplified Schematic Block Diagram

Table 1. PIN FUNCTION DESCRIPTION

Pin No. 4-bump CSP	Pin Name	Description
B2	OUT	Regulated output voltage pin. A small 1 μ F ceramic capacitor is needed from this pin to ground to assure stability.
B1	GND	Power supply ground. Soldered to large copper plane allows for better heat dissipation.
A1	EN	Enable pin. Driving EN over 0.9 V turns on the regulator. Driving EN below 0.4 V puts the regulator into shutdown mode.
A2	IN	Input pin. A small capacitor is needed from this pin to ground to assure stability.

Table 2. ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage (Note 1)	V_{IN}	-0.3 V to 6 V	V
Output Voltage	V_{OUT}	-0.3 V to $V_{IN} + 0.3$ V	V
Enable Input	V_{EN}	-0.3 V to $V_{IN} + 0.3$ V	V
Output Short Circuit Duration	t_{SC}	∞	s
Maximum Junction Temperature	$T_{J(MAX)}$	150	$^{\circ}$ C
Storage Temperature	T_{STG}	-55 to 150	$^{\circ}$ C
ESD Capability, Human Body Model (Note 2)	ESD_{HBM}	2000	V
ESD Capability, Machine Model (Note 2)	ESD_{MM}	200	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

2. This device series incorporates ESD protection and is tested by the following methods:

ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)

ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)

Latchup Current Maximum Rating tested per JEDEC standard: JESD78.

NCP729

TYPICAL CHARACTERISTICS

Figure 39. ESR vs. Output Current

APPLICATIONS INFORMATION

General

The NCP729 is a high performance 200 mA Very Low Dropout Linear Regulator. This device delivers excellent noise and dynamic performance. It features typical quiescent current of 35 μ A at no-load, ultra-low noise of 10 μ V_{RMS} and high PSRR of 72 dB at 1 kHz. Such excellent dynamic parameters and small package size make the device an ideal choice for powering the precision analog and noise sensitive circuitry in portable applications. NCP729 requires very small voltage headroom for correct operation. The dropout for 3.3 V voltage option is only 68 mV (typ.) A logic EN input provides ON/OFF control of the output voltage. When the EN is low the device consumes as low as typ. 300 nA from the IN pin.

The device is fully protected in case of output overload, output short circuit condition and overheating, assuring a very robust design.

Input Capacitor (C_{IN})

It is recommended to connect a minimum of 1 μ F Ceramic X5R or X7R capacitor close to the IN pin of the device. This capacitor will provide a low impedance path for unwanted AC signals or noise modulated onto constant input voltage.

There is no requirement for the min./max. ESR of the input capacitor but it is recommended to use ceramic capacitors for their low ESR and ESL. A good input capacitor will limit the influence of input trace inductance and power source resistance during sudden load current changes. Larger input capacitor may be necessary if fast and large line/load transients are encountered in the application.

Output Capacitor (C_{OUT})

The NCP729 is designed to operate with a small 1.0 μ F ceramic capacitor on the output. To assure proper operation it is recommended to use min. 1.0 μ F capacitor with the initial tolerance of $\pm 10\%$, made of X7R or X5R dielectric material types.

NCP729 is internally compensated so there is no requirement for the minimum value of Equivalent Series Resistance (ESR) for the C_{OUT} but the maximum value of ESR should be less than 500 m Ω .

Larger output capacitors could be used to improve the load transient response or high frequency PSRR. This part is not designed to work with tantalum or electrolytic capacitors on the output due to their large ESR and ESL. The equivalent series resistance of tantalum capacitors is also strongly dependent on the temperature, increasing at low temperatures. The tantalum capacitors are generally more costly than ceramic capacitors.

The table below lists examples of suitable output capacitors:

Part Number	Description
C0402C105K8PACTU	1 μ F Ceramic $\pm 10\%$, 10 V, 0402, X5R
C1005X5R1A105K	- -
GRM155R61A105KE15D	- -
0402ZD105KAT2A	- -
MCCA000571	1 μ F Ceramic $\pm 10\%$, 50 V, 1206, X7R
ECJ-0EB0J475M	4.7 μ F Ceramic $\pm 20\%$, 6.3 V, 0402, X5R

No-load Operation

The regulator remains stable and regulates the output voltage properly within the $\pm 2\%$ tolerance limits with no external load applied to the output.

Enable Operation

The NCP729 uses the EN pin to enable, disable its output and to deactivate, activate the active output discharge function.

If the EN pin voltage is < 0.4 V the device is guaranteed to be disabled. The pass transistor is turned-off and the active discharge transistor is active so that the output voltage V_{OUT} is pulled to GND through a 1 k Ω resistor. In the disable state the device consumes as low as typ. 300 nA from the V_{IN}.

If the EN pin voltage > 0.9 V the device is guaranteed to be enabled. The output voltage is regulated at the nominal value and the active discharge transistor is turned-off.

The EN pin has internal pull-down current source with typ. value of 110 nA which assures that the device is turned-off when the EN pin is not connected. A build in 2 mV of hysteresis in the EN prevents from periodic on/off oscillations that can occur due to noise.

In the case where the EN function isn't required the EN pin should be tied directly to IN.

Undervoltage Lockout

The internal UVLO circuitry assures that the device becomes disabled when the V_{IN} falls below typ. 1.5 V. When the V_{IN} voltage ramps-up the NCP729 becomes enabled for V_{IN} ≥ 1.6 V. The 100 mV hysteresis prevents from on/off oscillations that can occur due to noise on V_{IN} line.

Reverse Current

The PMOS pass transistor has an inherent body diode which will be forward biased in the case that V_{OUT} $> V_{IN}$. Due to this fact in cases where the extended reverse current condition is anticipated the device may require additional external protection.

Output Current Limit

Output Current is internally limited within the IC to a typical 400 mA. The NCP729 will source this amount of current measured with the output voltage 100 mV lower than the nominal V_{OUT} . The short circuit current flowing to the IN pin when the Output Voltage is directly shorted to ground will be just slightly above 400 mA – typ. 410 mA. The current limit and short circuit were verified to work properly and to secure the part from the damage up to $V_{IN} = 5.5$ V at $T_A = 25^\circ\text{C}$. There is no limitation for the short circuit duration.

Thermal Shutdown

When the die temperature exceeds the Thermal Shutdown threshold ($T_{SD} = 165^\circ\text{C}$ typical), Thermal Shutdown event is detected and the device is disabled. The IC will remain in this state until the die temperature decreases below the Thermal Shutdown Reset threshold ($T_{SDU} = 140^\circ\text{C}$ typical). Once the IC temperature falls below the 140°C the LDO is enabled. The thermal shutdown feature provides protection from a catastrophic device failure due to accidental overheating. This protection is not intended to be used as a substitute for proper heat sinking.

Power Dissipation

As power dissipated in the NCP729 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. For reliable operation junction temperature should be limited to $+125^\circ\text{C}$.

The maximum power dissipation the IC can handle is given by:

$$P_{D(MAX)} = \frac{[125 - T_A]}{\theta_{JA}} \quad (\text{eq. 1})$$

The power dissipated by the NCP729 for given application conditions can be calculated from the following equations:

$$P_D \approx V_{IN}(I_{GND}@I_{OUT}) + I_{OUT}(V_{IN} - V_{OUT}) \quad (\text{eq. 2})$$

Load Regulation

The NCP729 features excellent load regulation of typical $200 \mu\text{V}$ in the 0 mA to 200 mA range. Due to this fact at large load currents the major contributors to the output voltage shift will be the junction temperature increase and the PCB trace resistance.

Line Regulation

The IC features very good line regulation of typical $150 \mu\text{V/V}$ measured for the input voltage change from $V_{IN} = V_{OUT} + 0.3$ V to 5.5 V.

Power Supply Rejection Ratio

The NCP729 features very good Power Supply Rejection ratio. If desired the PSRR at higher frequencies in the range 100 kHz – 10 MHz can be tuned by the selection of C_{OUT} capacitor and proper PCB layout. Additional Ferrite Bead Input filter will further improve the PSRR.

Output Noise

The IC is designed for ultra-low noise output voltage. Figures 3 and 4 illustrate the noise performance for different V_{OUT} , I_{OUT} , C_{OUT} . Generally the noise performance in the indicated frequency range improves with increasing output current.

PCB Layout Recommendations

To obtain good transient performance and good regulation characteristics place C_{IN} and C_{OUT} capacitors close to the device pins and make the PCB traces wide. V_{OUT} , V_{IN} and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance for noise pickup.

In order to minimize the solution size use 0402 capacitors. Larger copper area connected to the pins will improve the device thermal resistance. The actual power dissipation can be calculated by the formula given in Equation 2.
