General Description

Applications

The MAX9491 multipurpose clock generator is ideal for communication applications. It offers a factory-programmable PLL output that can be set to almost any frequency, ranging from 4MHz to 200MHz. The MAX9491 uses a one-time-programmable (OTP) ROM to program the PLL output. The MAX9491 also features an integrated voltage-controlled crystal oscillator (VCXO) that is tuned by a DC voltage. The VCXO output is used as the PLL input. The VCXO has a wide ±200ppm (typ) tuning range. The OTP on the MAX9491 is factory preset, based upon the customer request. Contact the factory for samples with preferred frequencies.

The device operates from a 3.3V supply and is specified over the -40°C to +85°C extended temperature range. The MAX9491 is available in 14-pin TSSOP and 20-pin TQFN (5mm x 5mm) packages.

Telecommunications Data Networking Systems Home Entertainment Centers SOHO

• 5MHz to 35MHz for Crystal-Clock Reference

- 5MHz to 50MHz for a Driver Clock Reference
- One Fractional-N PLL with Buffered Output

Features

ABSOLUTE MAXIMUM RATINGS

V _{DD} to GND	0.3V to +4.0V
V _{DDA} to AGND	0.3V to +4.0V
All Other Pins to GND	0.3V to V _{DD} + 0.3V
Short-Circuit Duration	
(all LVCMOS outputs)	
ESD Protection (Human Body Model)	±2kV

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

 $(V_{DD} = V_{DDA} = +3.0V \text{ to } +3.6V \text{ and } T_A = -40^{\circ}\text{C} \text{ to } +85^{\circ}\text{C}$. Typical values at $V_{DD} = V_{DDA} = 3.3V$, $T_A = +25^{\circ}\text{C}$, unless otherwise noted.) (Note 1)

Pin Description

PI	N		FUNCTION
TQFN	TSSOP	NAME	FUNCTION
1	5	TUNE	VCXO Tune Voltage Input. If using a reference clock input or VCXO is not used, connect TUNE to $V_{\mbox{DD}}.$
2		V _{DDA}	Analog Power Supply. Bypass to GND with a $0.1\mu F$ capacitor.
3		AGND	Analog Ground
4, 10, 11	6, 9, 11	GND	Ground
5	7	CLK_OUT	Output Clock. Internally pulled down.
6–9, 14, 19, 20	2, 3, 8, 10	I.C.	Internally Connected. Leave unconnected for normal operation.
12, 13, 16	4, 12	V _{DD}	Power Supply. Bypass to GND with a 0.1µF capacitor.
15	13	PD	Active-Low Power-Down Input. Pull high for normal operation. Drive PD low to place MAX9491 in power-down mode. Internally pulled down.
17	14	X2	Crystal Connection 2. Leave unconnected if using a reference clock.
18	1	X1	Crystal Connection 1 or Reference Clock Input
EP	_	EP	Exposed Paddle (TQFN Only). Connect EP to GND or leave unconnected.

Detailed Description

The MAX9491 features a programmable fractional-N PLL, so frequencies between 4MHz to 200MHz can be generated. The device provides a buffered PLL clock output. The crystal input frequency can be between 5MHz and 35MHz, and the clock input between 5MHz and 50MHz. The internal VCXO has a fine-tuning range of \pm 200ppm.

Power-Down

Driving PD low places the MAX9491 in power-down mode. PD then sets CLK_OUT to high impedance and

shuts down the PLL. CLK_OUT has an 80k Ω (typ) internal pulldown resistor.

Voltage-Controlled Crystal Oscillator (VCXO)

The MAX9491's internal VCXO produces a reference clock for the PLL used to generate the CLK_OUT. The oscillator uses a crystal as the base frequency reference and has a voltage-controlled tuning input for micro adjustment in a ± 200 ppm range. The tuning voltage, V_{TUNE}, can vary from 0 to 3V as shown in Figure 1. The crystal should be AT-cut and oscillate on its fundamental mode with ± 30 ppm. The crystal shunt capacitor

should be less than 10pF, including board parasitic capacitance. To achieve up to ±200ppm pullability, make sure the crystal-loading capacitance is less than 14pF. The VCXO is a free-running oscillator. It starts oscillating

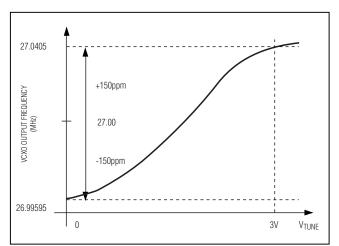

Figure 1. VCXO Tuning Range for a 27MHz Crystal

with an internal POR signal and can be disabled by $\overline{\text{PD}}.$ When VCXO is not used, connect TUNE to V_DD.

Applications Information

Using an Input Clock as the Reference

When an input clock is used as the reference, connect the input clock to X1, leave X2 unconnected, and connect TUNE to V_{DD} .

Crystal Selection

When using a crystal with the MAX9491's internal oscillator, connect the crystal to X1 and X2. Choose an ATcut crystal that oscillates on its fundamental mode with \pm 30ppm and loading capacitance less than 14pF. To achieve a wide VCXO tuning range, select a crystal with motional capacitance greater than 7fF and connect 6pF or less shunt capacitors at both X1 and X2 to ground. When the VCXO is used as an oscillator, select both shunt capacitors to approximately 13pF. The optimal shunt capacitors for achieving minimum frequency offset can be determined experimentally.

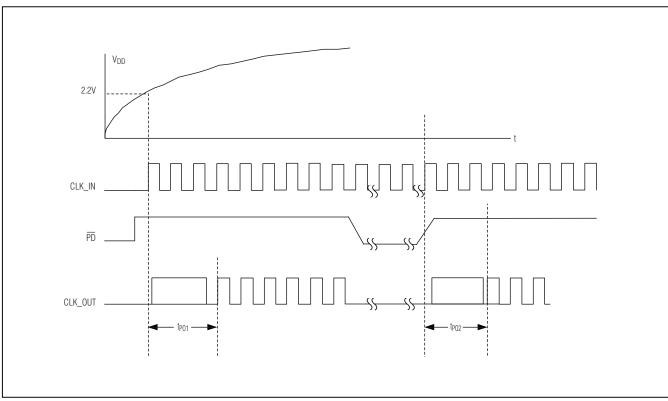

Figure 2. PLL Settling Time

Board Layout Considerations and Bypassing

The MAX9491's high-frequency oscillator requires proper layout to ensure stability. For best performance, place components as close as possible to the device.

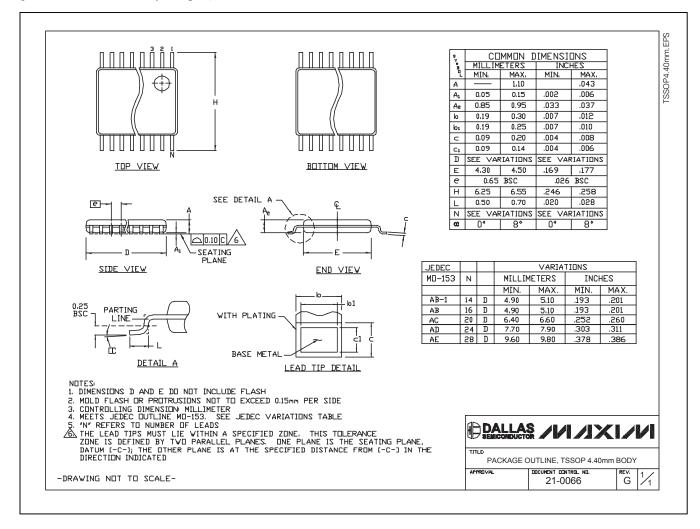

Digital or AC transient signals on GND can create noise at the clock output. Return GND to the highest quality ground available. Bypass each V_{DD} and V_{DDA} with a 0.1µF capacitor, placed as close as possible to the device. Careful PC board ground layout minimizes crosstalk between the output and digital inputs.
